AQUASNAP® 30RB060-390 Air-Cooled Chillers

60 to 390 Nominal Tons
(210 to 1370 kW)

AQUASNAP®

The AquaSnap chiller is an effective all-in-one package that is easy to install and easy to own. AquaSnap chillers cost less to purchase and install, and then operate quietly and efficiently. Value-added features include:

- Rotary scroll compression
- Puron® HFC refrigerant
- Quiet AeroAcoustic™ fan system
- Easy to use *ComfortLink™* controls
- Integrated hydronic pump package

Features/Benefits

Carrier's superior chiller design provides savings at initial purchase, at installation, and for years afterward.

Costs less right from the start

Only Carrier's AquaSnap chillers feature a compact, all-in-one package design that installs quickly and easily on the ground or the rooftop. The optional pump and hydronic components are already built in; this costs less than buying and installing the components individually. The chiller's fully integrated and pre-assembled hydronic system installs in minutes. No other chiller in this class installs so easily and inexpensively. The preassembled and integrated hydronic module utilizes top-quality components and pumps to ensure years of reliable operation. The AquaSnap unit's high efficiency keeps costs down.

Puron
the environmentally sound refrigerant

90.1
COMPLIANT**

Features/Benefits (cont)

AquaSnap® chillers make noise in the marketplace, not the workplace

The AquaSnap chiller's AeroAcoustic fan is almost twice as quiet as the competition's per cfm. Much of the noise reduction is in frequencies where noise is most annoying, which makes AquaSnap chillers ideal for sound-sensitive environments. When cooler temperatures allow part-load operation or during scheduled nighttime operation, the units operate with fewer fans and become even quieter. AquaSnap chillers are quiet during the day and even quieter at night.

The savings will continue to mount

Besides costing less to buy and install, AquaSnap chillers are also more affordable to operate. Carrier's Aqua Series chillers are our most efficient air-cooled models. The AquaSnap chiller provides full-load EER (Energy Efficiency Ratio) up to 9.7 and IPLV (integrated part-load value) up to 14.2. AquaSnap chillers use ultraquiet, high-efficiency rotary scroll compressors, operated in tandem, trios or quads per independent circuit for greater efficiency at partial loads.

Electronic expansion valve (EXV) allows for precise control through all operating ranges, resulting in higher efficiencies.

Proven reliability that's built in

Thousands of AquaSnap chillers are already in service around the world. This field-proven design is backed by a 12-month warranty that includes the optional hydronic system (U.S. and Canada only). The compressors are maintenance-free and protected by an auto-adaptive control that minimizes compressor wear. Year-round operation is standard, from -20 F (-29 C) (with optional cooler heater and low ambient control) to 125 F (52 C).

Rotary scroll compressors provide smooth, quiet and reliable operation.

Multiple independent circuits are standard on all AquaSnap chillers for redundancy and greater reliability.

All-in-one package

AquaSnap chillers provide the most comprehensive chilled water circuit available for any air-cooled chiller. Included is a shell-in-tube direct-expansion cooler that may be remote-mounted. The cooler is also completely drainable with factory-installed vents and drains.

Electronic thermal-dispersion

flow switch is included with the cooler. The switch is factory installed and tested and contains no moving parts for high reliability.

Optional integrated hydronics package is more than just a pump, it is an entire chilled water system, including:

- Single/dual pumps up to 15 hp and 140 ft head
- Regular strainer
- Cleanout strainer
- Flow regulator
- Freeze protection to -20 F (with freeze protection option)
- Heaters
- Required piping
- Pressure/temperature taps
- Isolation check valves for dual pump systems

The factory-installed and tested hydronics package provides faster, simpler and less expensive installation.

Environmentally sound

Carrier's unique Puron® refrigerant enables you to make a responsible decision in the protection of the earth's ozone layer. Puron refrigerant is an HFC refrigerant that does not contain chlorine that is damaging to the ozone layer. Puron refrigerant is unaffected by the Montreal Protocol. Puron

refrigerant is a safe, non-toxic, efficient and environmentally sound refrigerant for the future.

Structurally sound

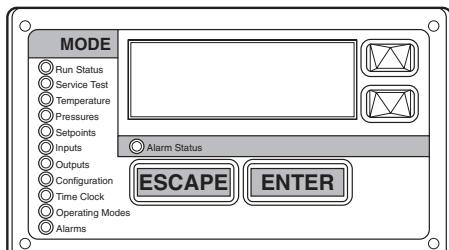

The base rail is industrial-quality 1/4-in. cold-rolled steel for maximum structural integrity. The zinc-dipped and painted galvanized frame (with SermaGuard™ coated screws) provides the best protection on the market for corrosion resistance. With such a structurally sound base, no perimeter base rail is needed.

ComfortLink™ controls speak your language

The ComfortLink controls communicate in plain English, making it as easy as possible to monitor and control each AquaSnap chiller while accurately maintaining fluid temperatures. The large Scrolling Marquee display acts as a window into the unit's operation, providing easy-to-read information about chiller performance and over 15 diagnostic functions. Carrier 30 Series chillers' ComfortLink controls provide features such as chilled water temperature reset, demand limiting, compressor wear minimization and protection, temperature and pressure displays and diagnostic functions. These controls result in higher chiller reliability, simplified training and more productive service calls with correspondingly lower operational and maintenance costs.

Carrier's exclusive handheld Navigator™ display provides convenience and powerful information in the palm of your hand. The Navigator display helps technicians to quickly diagnose problems and even prevent them from occurring.

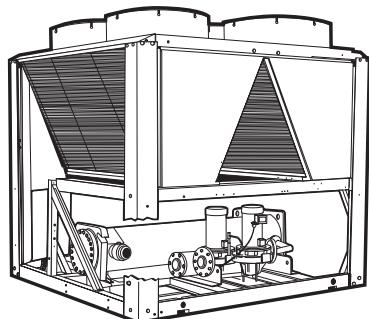

All AquaSnap units are ready to be used with the Carrier Comfort Network® (CCN) system.

Factory-installed options

Condenser coil options are available to match coil construction to the site conditions for the best durability. Refer to the Environmental Corrosion Protection white paper for more information.

Filter drier option exists for non-removable core filter driers for value engineering purposes. Standard units are equipped with a removable core filter drier. This option is not available with the Medium Temperature Brine option. The non-removable core filter drier is only available for sizes 30RB060-100.

Compressor suction service valve provides additional isolation of the compressor from the cooler vessel for service. Standard refrigerant discharge isolation and liquid valves enable service personnel to store the refrigerant charge in the cooler or condenser during servicing.

Suction line insulation is tubular closed-cell insulation. This option is required with the Medium Temperature Brine option and recommended for areas of high dew-points where condensation may be a concern.

Hydronic pump package option adds circulating pumps, a combination valve (isolation, modulation and check), strainer, vacuumic field piping connections, insulation and heaters, and pressure/temperature taps (3). The pumps are available in single or dual (lead/lag controlled) cooler pump versions with total dynamic head external to the chiller from approximately 20 to 140 ft (6.1 m to 42.7 m). Also includes heater and insulation for freeze protection to -20 F (-29 C) with the freeze protection option. The hydronic pump package is only available for sizes 30RB060-190.

Freeze protection with cooler heaters provides protection from cooler freezup to -20 F (-29 C).

Energy Management Module provides energy management capabilities to minimize chiller energy consumption. Several features are provided with this module including leaving fluid temperature reset, cooling set point reset or demand limit control from a 4 to 20 mA signal, 2-step demand limit control (from 0 to 100%) activated by a remote contact closure, and discrete input for "Ice Done" indication for ice storage system interface.

Service option provides a remote service port for Navigator™ display connection and a factory-installed convenience outlet includes 4-amp GFI (Ground Fault Interrupt) receptacle with independent fuse protection. Convenience outlet is 115-v female receptacle. Service option not available with 380-v.

Low ambient temperature head pressure control permits operation of the 30RB units to -20 F (-29 C) outdoor ambient temperature. The control is also available as a field-installed accessory and may require field-installed wind baffles.

Medium temperature brine option allows for leaving fluid temperatures to be set between 30 and 39 F (-1.1 and 3.9 C). Low ambient temperature head pressure control and suction line insulation are required.

Unit-mounted non-fused disconnect option provides non-fused disconnect capability for power and control located at the unit.

Minimum load control option allows additional capacity reduction for unit operation below the minimum step of unloading (down to 6% of the minimum unit capacity, depending on unit size). Minimum load control is also available as a field-installed accessory.

Security grilles protect the condenser coil from damage with coated wire grilles with openings of 1 by 4 in. (25 mm

x 102 mm). The security grille option requires the condenser coil trim panel option. Security grilles are also available as a field-installed accessory.

Condenser coil trim panels provide an aesthetic, finished appearance for the condenser coil ends of the cooler/pump connection side of the unit. Condenser coil trim panels are also available as a field-installed accessory.

Hail guards are comprised of sheet metal hoods that provide protection against damage from hail and flying debris. Hail guards are also available as a field-installed accessory.

Compressor sound enclosures provide sound reduction for the scroll compressors.

BACnet™ Translator Control provides an interface between the chiller and a BACnet Local Area Network (LAN, i.e., MS/TP EIA-485). BACnet Translator Control is also available as a field-installed accessory.

LON Translator Control interface between the chiller and a Local Operating Network (LON, i.e., LonWorks FT-10A ANSI/EIA-709.1). LON Translator Control is also available as a field-installed accessory.

Remote cooler option provides the additional hardware required to remotely mount the cooler from the unit. The cooler-unit separation is limited to 75 equivalent feet. The remote cooler option is also available as a field-installed accessory.

Field-installed accessories

Minimum load control accessory allows additional capacity reduction for unit operation below the minimum step of unloading (down to 6% of the minimum unit capacity, depending on unit size) via hot gas bypass.

Hail guards are comprised of sheet metal hoods that provide protection against damage from hail and flying debris. Hail guards are also available as a field-installed option.

Navigator™ display accessory provides a portable handheld display for convenient access to unit status, operation, configuration and troubleshooting diagnostics capability. The four-line, 80-character LCD display provides clear language information in English, French, Spanish, or Portuguese. The weatherproof enclosure and industrial grade extension cord enables the Navigator display to be ideally suited for outdoor applications. Magnets located on the back of the module allow attachment to any sheet metal component for hands-free operation.

Remote enhanced display accessory kit contains a remotely mounted indoor 40-character per line, 16-line display panel for unit diagnostics.

Chillervisor System Manager III multi-unit control accessory allows sequencing of between two and eight chillers in parallel. Pump control is also provided.

Low ambient temperature head pressure control permits operation of the 30RB units to -20 F (-29 C) outdoor ambient temperature. The control is also available as

a factory-installed option and may require field-installed wind baffles.

Energy Management Module provides energy management capabilities to minimize chiller energy consumption. Several features are provided with this module including leaving fluid temperature reset, cooling set point reset or demand limit control from a 4 to 20 mA signal, 2-step demand limit control (from 0 to 100%) activated by a remote contact closure (one-step demand limit does not require the Energy Management Module), and discrete input for "Ice Done" indication for ice stage system interface.

Expansion tank enables the chilled water system to accommodate fluctuations in volume based on increases or decreases in fluid temperature.

Remote service port consists of a receptacle for Navigator connection. The port is housed in a waterproof enclosure conveniently located for easy access to information during operation and maintenance routines.

Convenience outlet includes 4-amp GFI (Ground Fault Interrupt) receptacle with independent fuse protection. Convenience outlet is 115V female receptacle. Not available with 380V.

Remote cooler accessory provides the additional hardware required to remotely mount the cooler from the unit. The cooler-unit separation is limited to 75 equivalent feet. The remote cooler accessory is also available as a factory-installed option.

DataPort™ control is an interface device that allows a non-Carrier controller to *read* values in the system elements connected to the Carrier Comfort Network® (CCN) Communication Bus using ASCII over a RS-232 connection. Externally remote mounted with power supply.

DataLINK™ control is an interface device that allows a non-Carrier controller to *read and write* values in the system elements connected to the CCN Communication Bus using ASCII over a RS-232 connection.

BACnet Translator Control provides an interface between the chiller and a BACnet Local Area Network (LAN, i.e., MS/TP EIA-485). BACnet Translator Control is also available as a factory-installed option.

LON Translator Control provides an interface between the chiller and a Local Operating Network (LON, i.e., LonWorks FT-10A ANSI/EIA-709.1). LON Translator Control is also available as a factory-installed option.

Security grilles protect the condenser coil from damage with coated wire grilles with openings of 1 by 4 in. (25 mm x 102 mm). The security grille accessory requires the condenser coil trim panel accessory. Security grilles are also available as a factory-installed option.

Condenser coil trim panels provide an aesthetic, finished appearance for the condenser coil ends of the cooler/pump connection side of the unit. Condenser coil trim panels are also available as a factory-installed option.

Selection procedure

Carrier's Packaged Chiller Builder Program provides quick, easy selection of Carrier's air-cooled liquid chillers. The program considers specific temperature, fluid and flow requirements among other factors such as fouling and altitude corrections.

Before selecting a chiller, consider the following points:

Leaving Water Temperature (LWT)

- If the LWT is less than 40 F (4.4 C), loop freeze protection to a minimum of 30° F (16.6° C) below the LWT set point is required. The medium temperature brine option is also required.
- If the LWT requirement is greater than 60 F (16 C), a mixing loop is required.

Entering Water Temperature (EWT)

- If the EWT requirement is greater than 85 F (29 C), a mixing loop is required. The EWT cannot exceed 85 F (29 C) for extended operation. Pulldown can be accomplished from 95 F (35 C).

Cooler Flow Rate or Cooler Delta-T

- The cooler delta-T must fall between 5 and 20° F (3 and 11° C).
- For larger or smaller delta-T applications, a mixing loop is required.
- If the cooler flow is variable and the rate of change of flow should not exceed 10% per minute, a loop volume of greater than 3 gallons per ton is recommended.

Cooler Pressure Drop

- A high cooler pressure drop can be expected when the cooler delta-T is low. A mixing loop can help to alleviate this situation.

Water Quality, Fouling factor

- Poor water quality can increase the cooler fouling.
- Higher than standard fouling factors lead to lower capacity and higher input kW from a given chiller size compared to running the same application with better quality water (and lower fouling factors).

Operation below 32 F (0° C)

- Low ambient head pressure control is required.
- Consider wind baffles if average wind speed is greater than 5 mph.
- Consider higher loop volumes, 6 to 10 gallons per nominal ton.
- Loop freeze protection with glycol is strongly recommended to a minimum of 15° F (8° C) below lowest anticipated ambient temperature.

- Cooler Heater option is required if no glycol is used.
- Chilled water pump control is strongly recommended; otherwise override capability is required.
- Consider the Remote Cooler Option.

Chiller idle below 32 F (0° C)

- Loop freeze protection with glycol is strongly recommended to a minimum of 15° F (8° C) below lowest anticipated ambient temperature.
- Cooler Heater option is required if no glycol is used.
- Chilled water pump control is strongly recommended; otherwise override capability is required.
- Drain the cooler — This will require a small amount of glycol for residual water. Cooler heaters (if provided) will need to be disconnected.
- Consider the Remote Cooler Option.

Highest allowable ambient air temperature is 125 F (52 C).

Cooling Capacity Requirement

- Do not oversize the chillers by more than 15% at design conditions.
- If close capacity control is required below the standard minimum step of unloading, the Minimum Load Control option should be employed.

Coil Corrosion Requirements

- Coastal Application
- Industrial Application
- Coastal/industrial Application
- Urban Application
- Farming

Chilled Water Pump External Head Requirement

Capacity Control

- Temperature Reset
- Return Water Reset
- Outside Air Temperature Reset
- Space Temperature Reset
- 4 to 20 mA Temperature Reset (requires an Energy Management Module)

Demand Limit

- 2-step (requires an Energy Management Module)
- 4 to 20 mA (requires an Energy Management Module)
- CCN Loadshed

To select a chiller, use the Packaged Chiller Builder Program or follow one of the procedures starting on page 29.

ENGLISH

I Determine 30RB unit size and operating conditions required to meet given capacity at given conditions.

Given:

Capacity 126 Tons
 Leaving Chilled Water Temp (LCWT) 44 F
 Cooler Water Temp Rise 10° F
 Condenser Entering Air Temp 95 F
 Fouling Factor (Cooler) 0.00010
 External System Pressure

Drop 40 ft wg (118 kPa)

NOTE: For other than 10° F (5.6° C) temperature rise, unit selection must be made using the chiller program in the electronic catalog.

II From Chiller Ratings table on page 40 and pressure drop curves on page 31, determine operating data for selected unit.

Unit 30RB130
 Capacity 127.3 Tons
 Power Input 158.3 kW
 Cooler Water Flow 304.3 gpm
 Pressure Drop 12.7 ft of water

SI

I Determine unit size and operating conditions required to meet given capacity at given conditions.

Given:

Capacity 270 kW
 Leaving Chilled Water Temp (LCWT) 7 C
 Cooler Water Temp Rise 5.6° C
 Condenser Entering Air Temp 35 C
 Fouling Factor (Cooler) 0.018
 External System Pressure Drop 200 kPa

NOTE: For other than approx. 5 to 6° C temperature rise, unit selection must be made using the chiller program in the electronic catalog.

II From Chiller Ratings table on page 43 and pressure drop curves on page 31, determine operating data for selected unit.

Unit 30RB080
 Capacity 270.3 kW
 Power Input 95.7 kW
 Cooler Water Flow 11.6 L/s
 Pressure Drop 22.4 kPa

PUMP IMPELLER SIZES

*Option Code refers to the Hydronics Option (position 11) in the model number. See the 30RB nomenclature on page 4 for option identification.

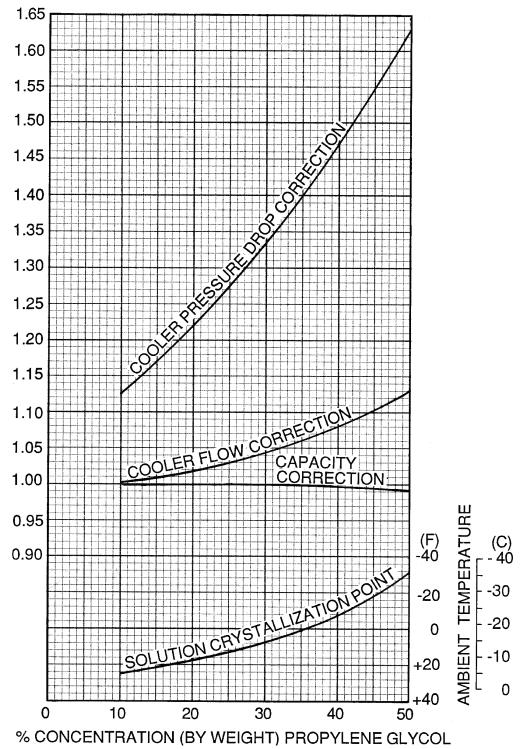

NOTE: Pump Selections are chiller size dependent. For example, dual pump "C" on a 30RB170 chiller is not the same as dual pump "C" on a 30RB130 chiller.

Selection procedure (cont)

PROPYLENE GLYCOL PERFORMANCE CORRECTION FACTORS AND SOLUTION CRYSTALLIZATION POINTS

Correction factors apply to published chilled water performance ratings from 40 to 60 F (4.4 to 15.6 C) LCWT.

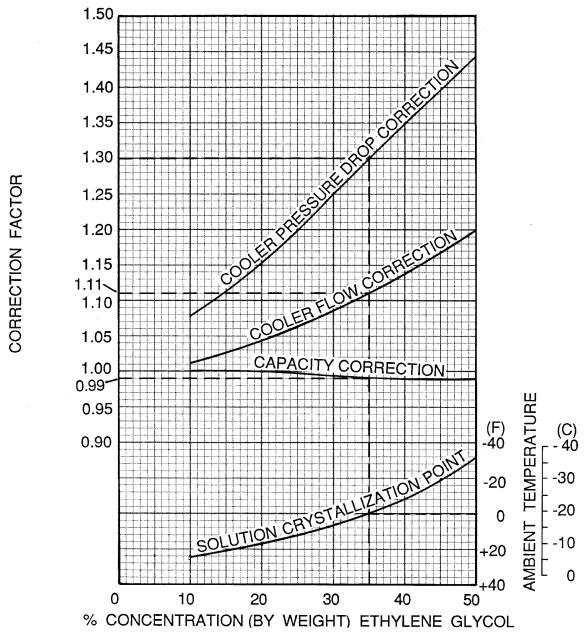

AquaSnap® pump selection

Several pump sizes are available for each AquaSnap chiller size to provide flexibility in matching water system requirements. A dual pump option is also available for primary/standby operation. The Carrier Packaged Chiller Builder Program must be used for pump selection.

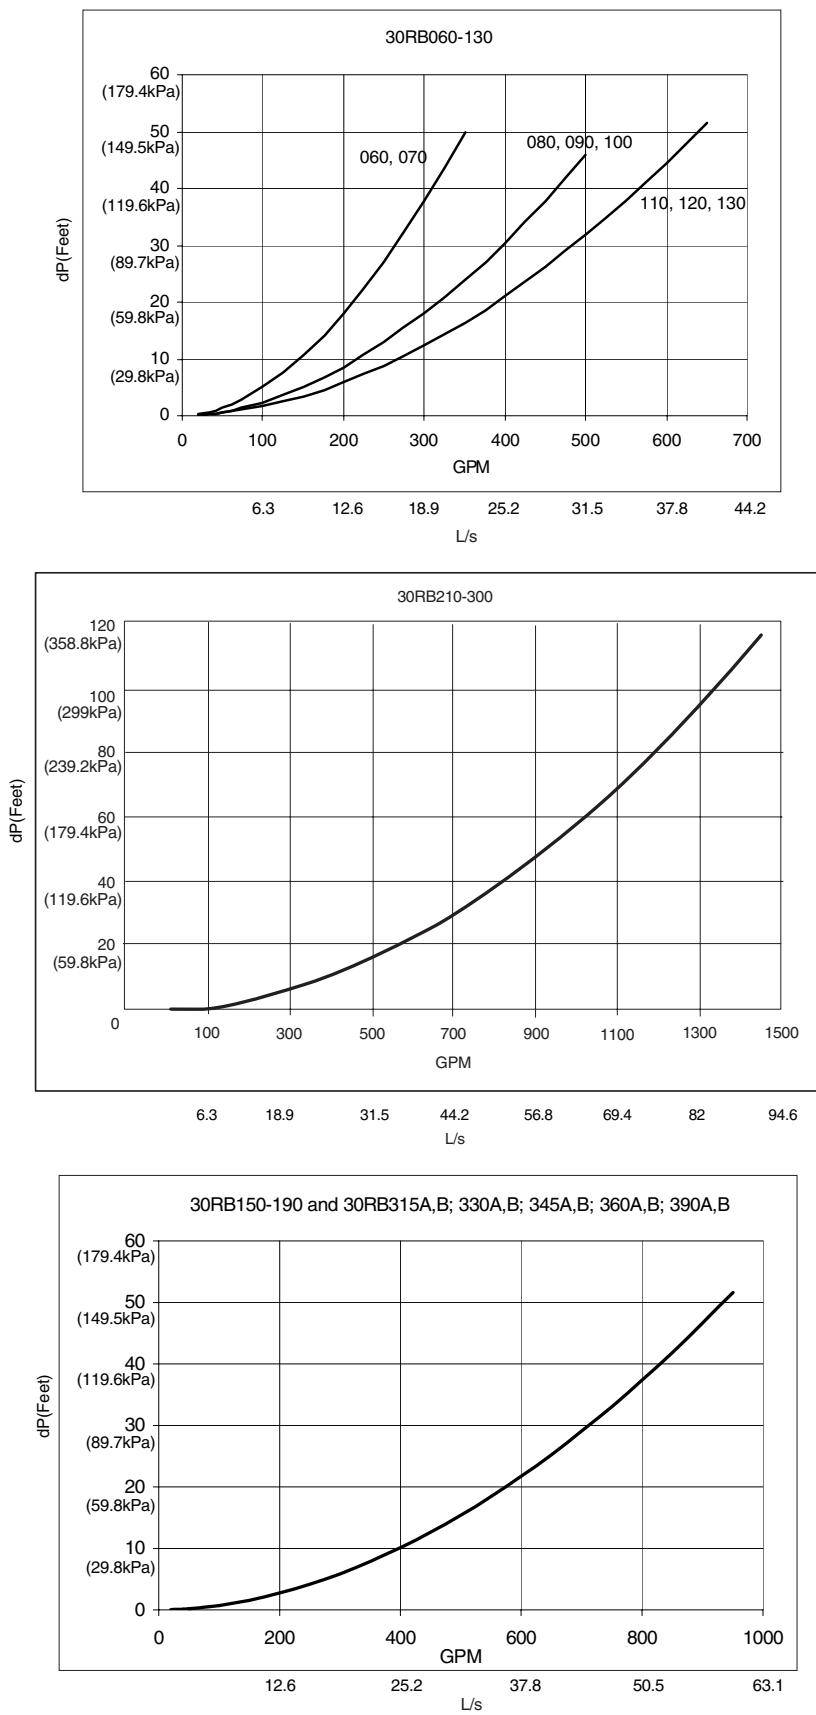

Proper water system design is critical; cooling loads, water pressure drops and proper water line sizing must be accounted for in order to ensure proper system operation. Incorrect or incomplete analysis/design of the water loop could lead to low water flow, loss of water temperature control, and excessive cycling of chiller compressors.

ETHYLENE GLYCOL PERFORMANCE CORRECTION FACTORS AND SOLUTION CRYSTALLIZATION POINTS

Correction factors apply to published chilled water performance ratings from 40 to 60 F (4.4 to 15.6 C) LCWT.

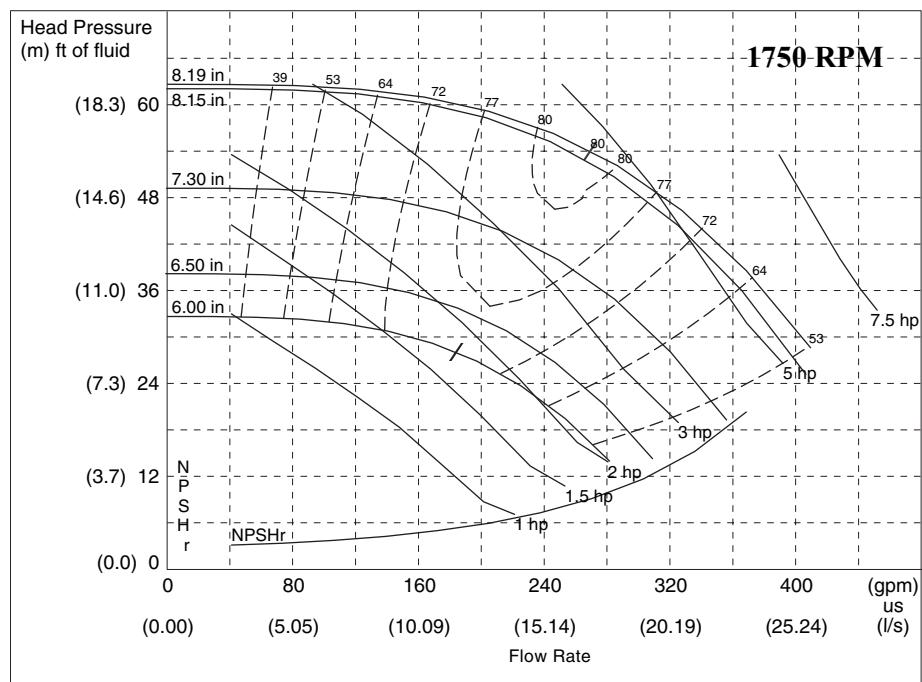

COOLER PRESSURE DROP CURVES

Selection procedure (cont)

PUMP CURVE I FOR HYDRONIC PACKAGE SINGLE PUMP (Fresh Water)

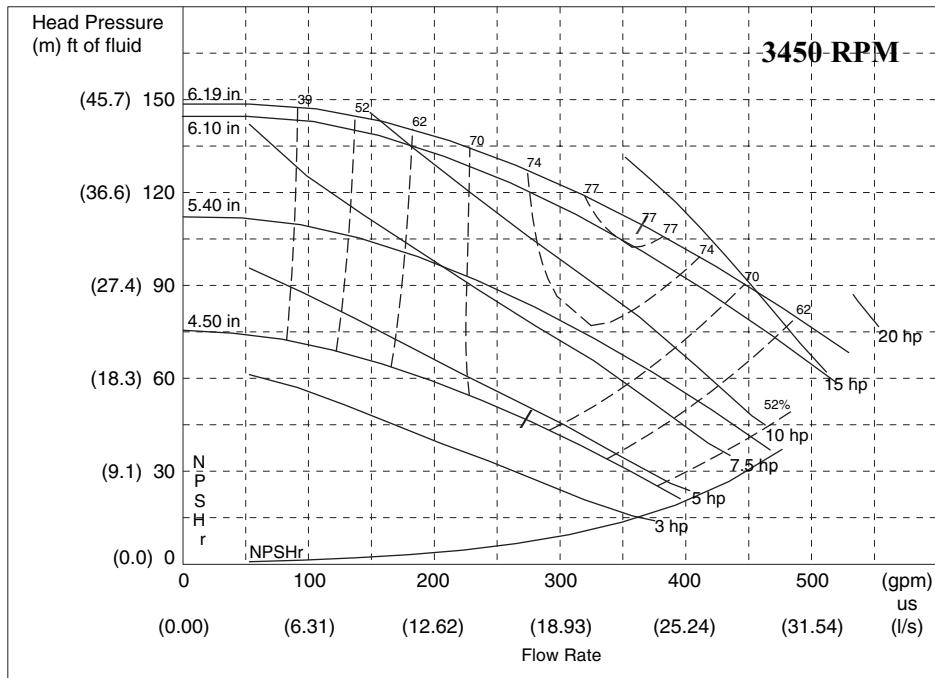

LEGEND

NPSH_r — Net Positive Suction Head (Pressure) Required

NOTE: Refer to the 30RB nomenclature on page 4 for option identification. Refer to the Pump Impeller Sizes table on page 29 for more information.

PUMP CURVE II FOR HYDRONIC PACKAGE SINGLE PUMP (Fresh Water)

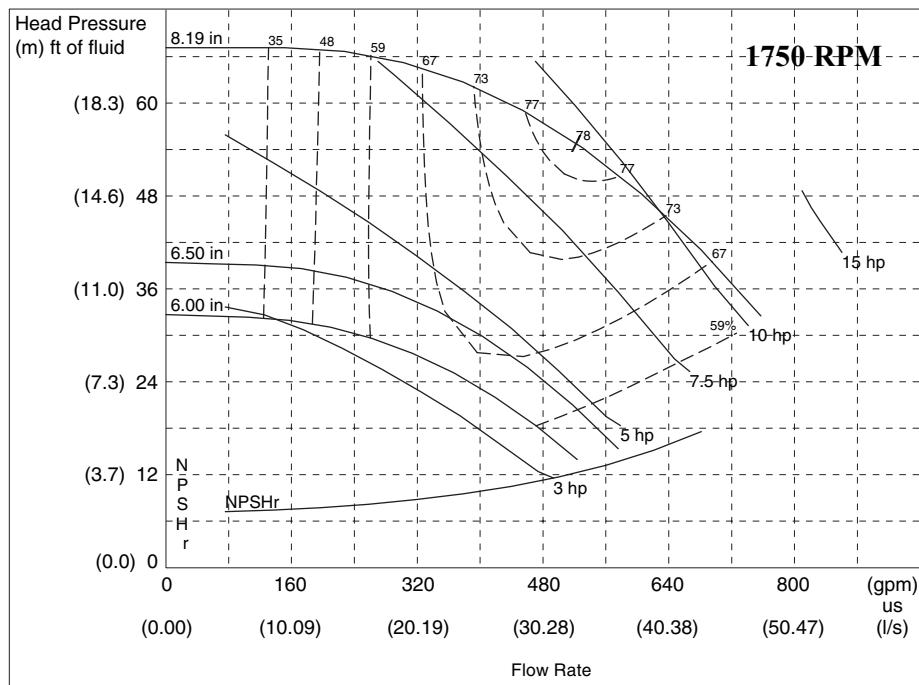

LEGEND

NPSH_r — Net Positive Suction Head (Pressure) Required

NOTE: Refer to the 30RB nomenclature on page 4 for option identification. Refer to the Pump Impeller Sizes table on page 29 for more information.

PUMP CURVE III FOR HYDRONIC PACKAGE SINGLE PUMP (Fresh Water)

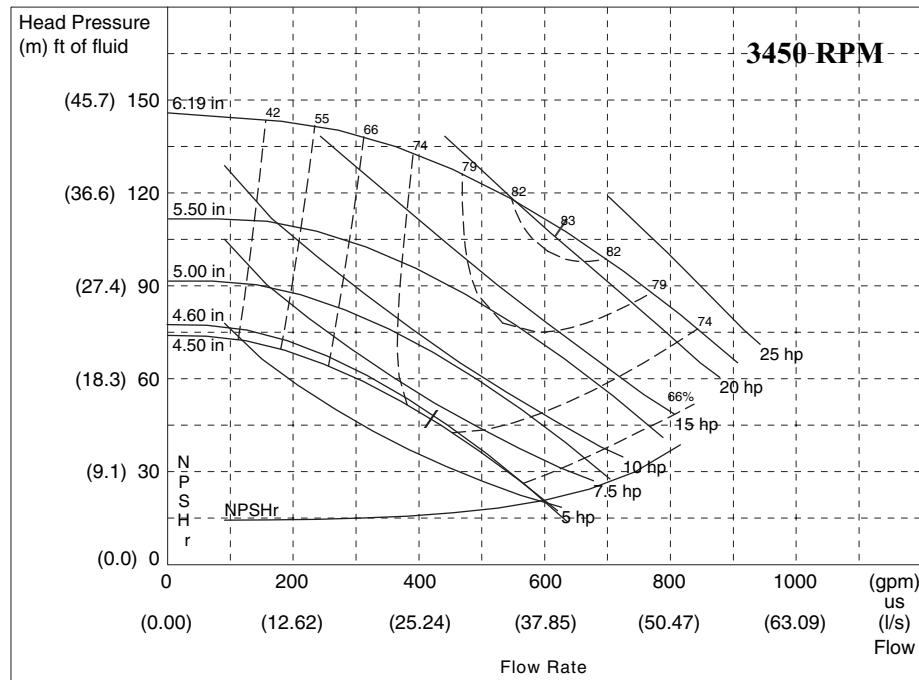

LEGEND

NPSH_r — Net Positive Suction Head (Pressure) Required

NOTE: Refer to the 30RB nomenclature on page 4 for option identification. Refer to the Pump Impeller Sizes table on page 29 for more information.

PUMP CURVE IV FOR HYDRONIC PACKAGE SINGLE PUMP (Fresh Water)

LEGEND

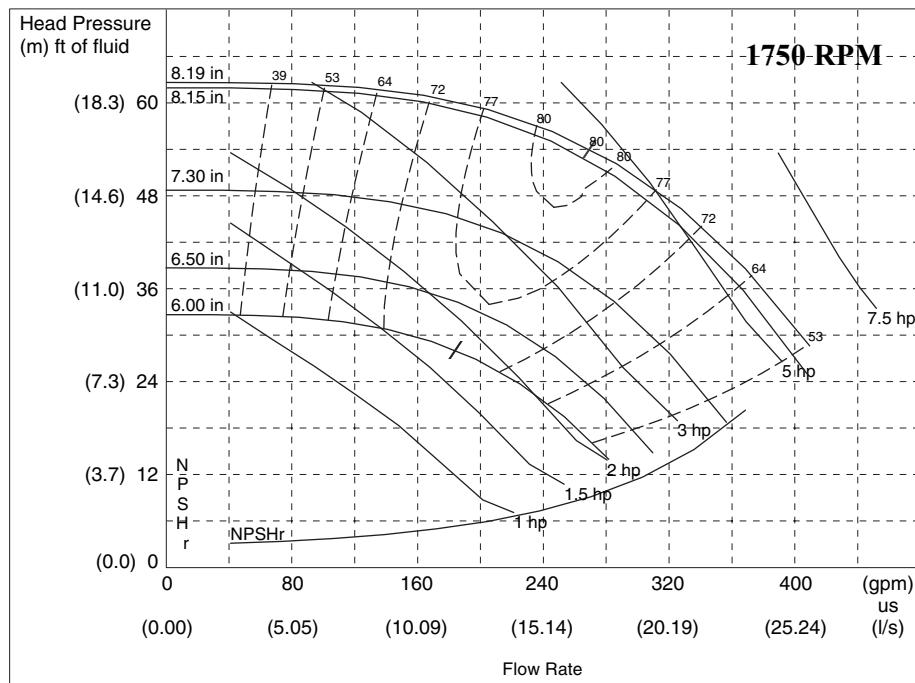

NPSH_r — Net Positive Suction Head (Pressure) Required

NOTE: Refer to the 30RB nomenclature on page 4 for option identification. Refer to the Pump Impeller Sizes table on page 29 for more information.

Selection procedure (cont)

PUMP CURVE V FOR HYDRONIC PACKAGE DUAL PUMP (Fresh Water)

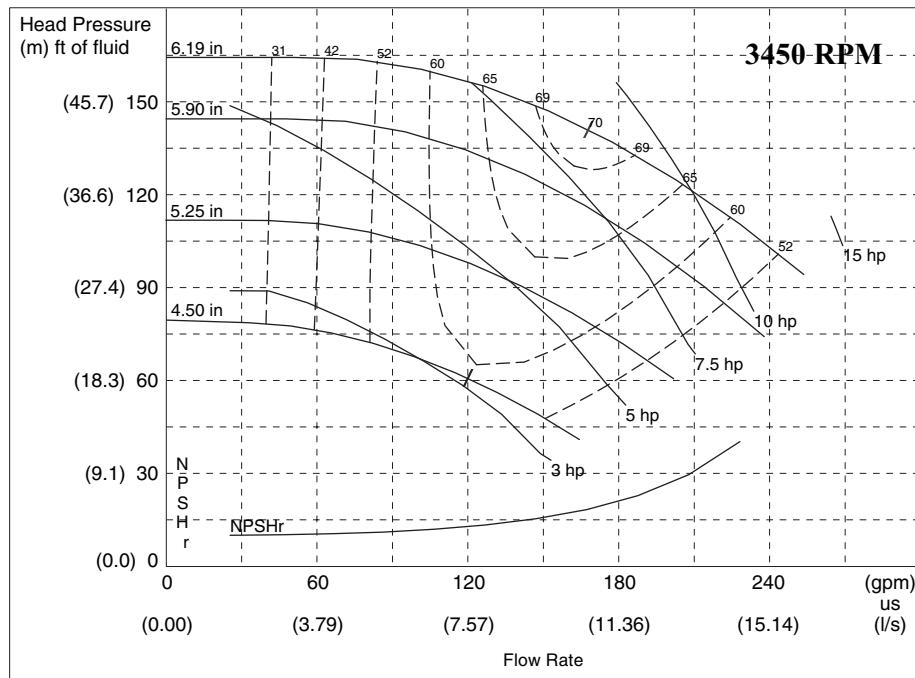

LEGEND

NPSH_r — Net Positive Suction Head (Pressure) Required

NOTE: Refer to the 30RB nomenclature on page 4 for option identification. Refer to the Pump Impeller Sizes table on page 29 for more information.

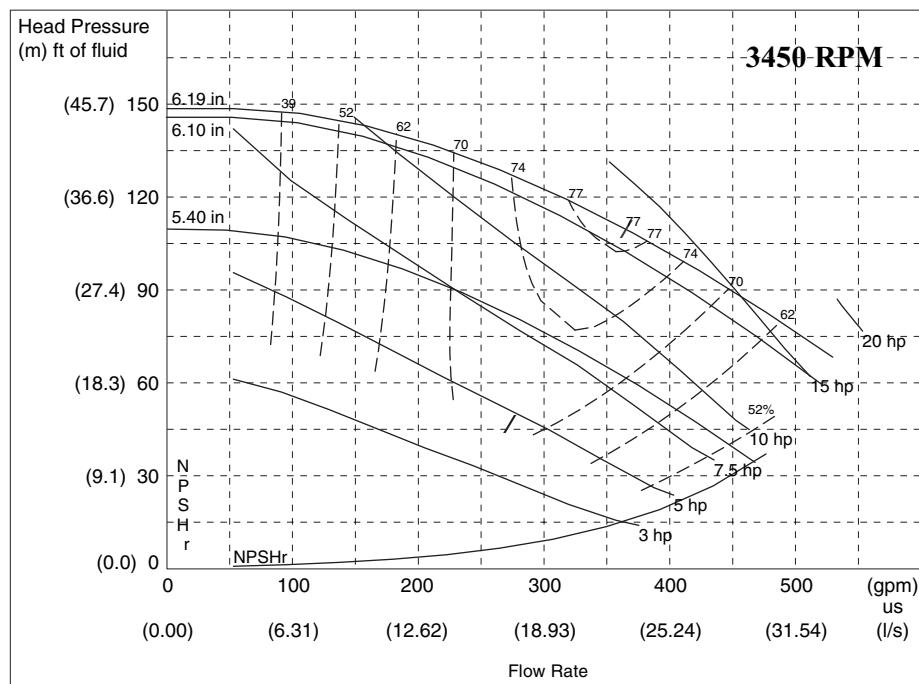

PUMP CURVE VI FOR HYDRONIC PACKAGE DUAL PUMP (Fresh Water)

LEGEND

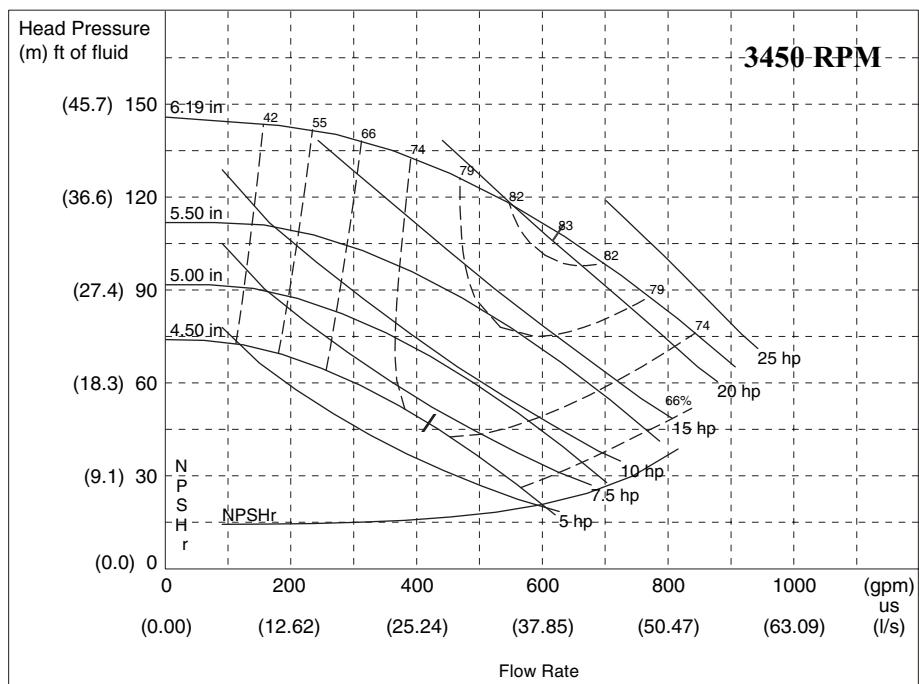

NPSH_r — Net Positive Suction Head (Pressure) Required

NOTE: Refer to the 30RB nomenclature on page 4 for option identification. Refer to the Pump Impeller Sizes table on page 29 for more information.

PUMP CURVE VII FOR HYDRONIC PACKAGE DUAL PUMP (Fresh Water)

LEGEND

NPSH_r — Net Positive Suction Head (Pressure) Required

NOTE: Refer to the 30RB nomenclature on page 4 for option identification. Refer to the Pump Impeller Sizes table on page 29 for more information.

PUMP CURVE VIII FOR HYDRONIC PACKAGE DUAL PUMP (Fresh Water)

LEGEND

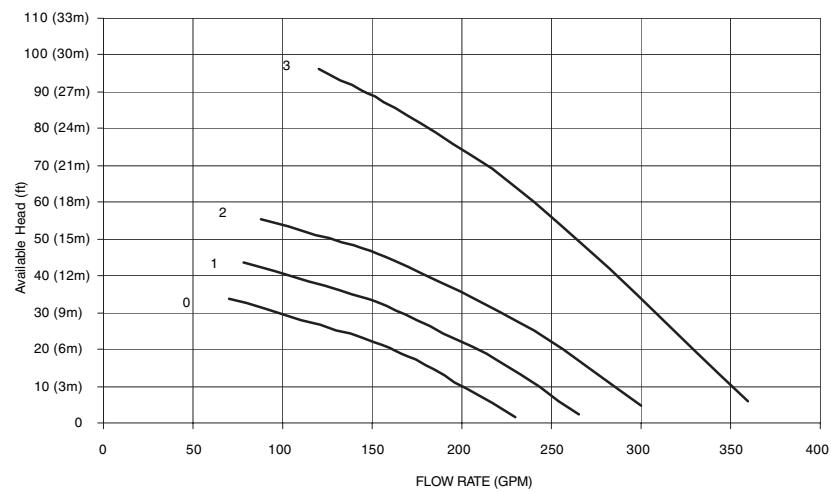

NPSH_r — Net Positive Suction Head (Pressure) Required

NOTE: Refer to the 30RB nomenclature on page 4 for option identification. Refer to the Pump Impeller Sizes table on page 29 for more information.

ICF — Instantaneous Current Flow MOCP — Maximum Overcurrent Protection
 MCA — Minimum Circuit Amps XL — Across-the-Line Start

NOTES:

- Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is: voltage, 2%; amps 10%.
- All units or modules have single point primary power connection. (Each unit or module requires its own power supply.) Main power must be supplied from a field-supplied disconnect.
- Cooler heater is wired into the control circuit so it is always operable as long as the power supply disconnect is on, even if any safety device is open.
- For MCA that is less than or equal to 380 amps, 3 conductors are required.
For MCA between 381 and 760 amps, 6 conductors are required.
For MCA between 761 and 1140 amps, 9 conductors are required.
For MCA between 1141 and 1520 amps, 12 conductors are required.
Calculation of conductors required is based on 75 C copper wire.
- Wiring for main field supply must be rated 75 C minimum. Use copper for all units.
 - Incoming wire size range for the terminal block is no. 4 AWG (American Wire Gage) to 500 kcmil.
 - Incoming wire size range of non-fused disconnect with MCA up to 599.9 amps is 3/0 to 500 kcmil.
 - Incoming wire size range of non-fused disconnect with MCA from 600 to 799.9 amps is 1/0 to 500 kcmil.
 - Incoming wire size range of non-fused disconnect with MCA from 800 to 1199.9 amps is 250 kcmil to 500 kcmil.
- Hydronic pump packages are not available as a factory-installed option for units 30RB210-390.
- Power draw includes both crankcase heaters and cooler heaters (where used). Each compressor has a crankcase heater which draws 56 watts of power. Units ordered with the cooler heater option have 1 (060-150) or 2 (160-300) cooler heaters, 825 watts each.

LEGEND

ICF — Instantaneous Current Flow MOCP — Maximum Overcurrent Protection
 MCA — Minimum Circuit Amps XL — Across-the-Line Start

NOTES:

- Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is: voltage, 2%; amps 10%.
- All units and modules have single point primary power connection. (Each unit or module requires its own power supply). Main power must be supplied from a field-supplied disconnect.
- Cooler heater is wired into the control circuit so it is always operable as long as the power supply disconnect is on, even if any safety device is open.
For MCA that is less than or equal to 380 amps, 3 conductors are required.
For MCA between 381 and 760 amps, 6 conductors are required.
For MCA between 761 and 1140 amps, 9 conductors are required.
For MCA between 1141 and 1520 amps, 12 conductors are required.
Calculation of conductors required is based on 75 C copper wire.
- For MCA that is greater than 1520 amps, 18 conductors are required.

5. Wiring for main field supply must be rated 75 C minimum. Use copper for all units.

- Incoming wire size range for the terminal block is no. 4 AWG (American Wire Gage) to 500 kcmil.
- Incoming wire size range of non-fused disconnect with MCA up to 599.9 amps is 3/0 to 500 kcmil.
- Incoming wire size range of non-fused disconnect with MCA from 600 to 799.9 amps is 1/0 to 500 kcmil.
- Incoming wire size range of non-fused disconnect with MCA from 800 to 1199.9 amps is 250 kcmil to 500 kcmil.
- Hydronic pump packages are not available as a factory-installed option for units 30RB210-390.
- Power draw includes both crankcase heaters and cooler heaters (where used). Each compressor has a crankcase heater which draws 56 watts of power. Units ordered with the cooler heater option have 1 (060-150) or 2 (160-300) cooler heaters, 825 watts each.

LEGEND

ICF = Instantaneous Current Flow

MOCP = Maximum Overcurrent Protection

Instantaneous Current
(Ckt1/Ckt2)

MOOC Maximum Overcurrent
(Ckt1/Ckt2)

- NOTES:**

 1. Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is: voltage, 2%; amps 10%.
 2. Control power is derived from main power. No separate control power connection is required.
 3. Cooler heater is wired into the control circuit so it is always operable as long as the power supply disconnect is on, even if any safety device is open.
 4. For MCA that is less than or equal to 380 amps, 3 conductors are required.
For MCA between 381 and 760 amps, 6 conductors are required.
For MCA between 761 and 1140 amps, 9 conductors are required.
For MCA between 1141 and 1520 amps, 12 conductors are required.
Calculation of conductors required is based on 75°C copper wire.

5. Wiring for main field supply must be rated 75 C minimum. Use copper for all units.

- a. Incoming wire size range for the terminal block is no. 4 AWG (American Wire Gage) to 500 kcmil.
 - b. Incoming wire size range of non-fused disconnect with MCA up to 599.9 amps is 3/0 to 500 kcmil.
 - c. Incoming wire size range of non-fused disconnect with MCA from 600 to 799.9 amps is 1/0 to 500 kcmil.
 - d. Incoming wire size range of non-fused disconnect with MCA from 800 to 1199.9 amps is 250 kcmil to 500 kcmil.

6. Hydronic pump packages are not available as a factory-installed option for units 30RB210-390.

7. Power draw includes both crankcase heaters and cooler heaters (where used). Each compressor has a crankcase heater which draws 56 watts of power. Units ordered with the cooler heater option have 1 (060-150) or 2 (160-300) cooler heaters, 825 watts each.

LEGEND

ICF — Instantaneous Current Flow **MOCP** — Maximum Overcurrent Protection
(Ckt1/Ckt2) **MCA** — Minimum Circuit Amps **XL** — Across-the-Line Start

NOTES:

- Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is: voltage, 2%; amps 10%.
- Control power is derived from main power. No separate control power connection is required.
- Cooler heater is wired into the control circuit so it is always operable as long as the power supply disconnect is on, even if any safety device is open.
- For MCA that is less than or equal to 380 amps, 3 conductors are required.
For MCA between 381 and 760 amps, 6 conductors are required.
For MCA between 761 and 1140 amps, 9 conductors are required.
For MCA between 1141 and 1520 amps, 12 conductors are required.
Calculation of conductors required is based on 75 C copper wire.

- Wiring for main field supply must be rated 75 C minimum. Use copper for all units.
- Incoming wire size range for the terminal block is no. 4 AWG (American Wire Gage) to 500 kcmil.
- Incoming wire size range of non-fused disconnect with MCA up to 599.9 amps is 3/0 to 500 kcmil.
- Incoming wire size range of non-fused disconnect with MCA from 600 to 799.9 amps is 1/0 to 500 kcmil.
- Hydronic pump packages are not available as a factory-installed option for units 30RB210-390.
- Power draw includes both crankcase heaters and cooler heaters (where used). Each compressor has a crankcase heater which draws 56 watts of power. Units ordered with the cooler heater option have 1 (060-150) or 2 (160-300) cooler heaters, 825 watts each.

Controls

Microprocessor

The *ComfortLink™* microprocessor controls overall unit operation. Its central executive routine controls a number of processes simultaneously. These include internal timers, reading inputs, analog to digital conversions, fan control, display control, diagnostic control, output relay control, demand limit, capacity control, head pressure control, and temperature reset. Some processes are updated almost continuously, others every 2 to 3 seconds, and some every 30 seconds. The microprocessor routine is started by switching the Emergency ON-OFF switch to ON position. Pump control of external pumps (where so configured) or optional internal pump, will energize the cooler pump to the internal (or CCN) time schedule (or input occupied signal from external system).

Where dual pumps are utilized only one pump will be operated at a time. The control will start the pump with the least hours. When the unit receives a call for cooling (based on a deviation from chilled water set point), the unit stages up in capacity to maintain the cooler fluid set point. The first compressor starts 1 to 3 minutes after the call for cooling. The *ComfortLink* microprocessor controls the capacity of the chiller by cycling compressors at a rate to satisfy actual dynamic load conditions. The control maintains leaving-fluid temperature set point shown on the Scrolling Marquee display board through intelligent cycling. Accuracy depends on loop volume, loop flow rate, load, outdoor-air temperature, number of stages, and particular stage being cycled off. No adjustment for cooling range or cooler flow rate is required, because the control automatically compensates for cooling range by measuring both return-fluid temperature and leaving-fluid temperature. This is referred to as leaving-fluid temperature control with return-fluid temperature compensation.

The basic logic for determining when to add or remove a stage is a time band integration of deviation from set point plus rate of change of leaving-fluid temperature. When leaving-fluid temperature is close to set point and slowly moving closer, logic prevents addition of another stage.

If 1° F per minute (0.6° C per minute) pulldown control has been selected (adjustable setting), no additional steps of capacity are added as long as the difference between leaving-fluid temperature and set point is greater than 4° F (2.2° C) and rate of change in leaving-fluid temperature is greater than the selected pulldown control rate. If it has been less than 90 seconds since the last capacity change, compressors will continue to run unless a safety device trips. This prevents rapid cycling and also helps return oil during short on periods.

Sensors

Thermistors are used to control temperature-sensing inputs to microprocessor. Additional thermistor sensors may be used as remote temperature sensors for optional LCWT reset.

- Cooler leaving chilled fluid temperature (T1)
- Cooler entering fluid (return) temperature (T2)
- Outside-air temperature (T9)

Two refrigerant pressure transducers are used in each circuit for sensing suction and discharge pressure. The microprocessor uses these inputs to control capacity and fan cycling.

- Saturated condensing temperature
- Cooler saturation temperature

Control sequence

Off cycle — If ambient temperature is below 36 F (2 C), cooler heaters (if equipped) are also energized.

Start-up — After the control circuit switches on, the pre-start process takes place, then microprocessor checks itself, starts pump (if configured) and waits for temperature to stabilize. The controlled pulldown feature limits compressor loading on start-up to reduce demand on start-up and unnecessary compressor usage. The microprocessor limits supply-fluid temperature decrease (start-up only) to 1° F (0.6° C) per minute.

Capacity control — On first call for cooling, microprocessor starts initial compressor and fan stage on lead circuit.

As additional cooling is required, additional compressors are energized.

Speed at which capacity is added or reduced is controlled by temperature deviation from set point and rate of temperature change of chilled fluid.

The Main Base Board (MBB) responds to the supply chilled water temperature to cycle the compressors to match cooling load requirements.

Minimum Load control valve is energized by the MBB. Valve allows hot gas to pass directly into the cooler circuit on the final step of unloading, permitting the unit to operate at lower loads with less compressor cycling.

Additional information

Detailed information on controls and operation is available in the Controls, Start-Up, Operation and Troubleshooting guide included with each unit. Packaged Service Training programs are also available. Contact your Carrier representative for more information.

Dual chiller control — The *ComfortLink™* controller allows 2 chillers (piped in series or parallel) to operate as a single chilled water plant with standard control functions coordinated through the master chiller controller. This standard *ComfortLink* feature requires a communication link between the 2 chillers and an additional thermistor for parallel operation.

Dynamic *ComfortLink* controls — Dynamic *ComfortLink* controls keep the chiller on line during periods of extreme operating conditions. If the entering fluid temperature is 85 F (29 C) or higher and the saturated suction temperature is 50 F (10 C) or higher the maximum operating pressure (MOP) feature limits the suction to keep the chiller online. The control automatically starts the chiller in the unloaded state to eliminate the potential of compressor overload due to high head pressure or low suction pressure. The controller will equalize run time on each circuit through the lead/lag feature. If a circuit becomes disabled, the control will automatically set the active circuit to lead, keeping the chiller online at a reduced capacity.

*Capacity control steps may vary due to compressor sequencing.

Standard ComfortLink™ controls with Scrolling Marquee display — A four-digit alphanumeric display shows all of the ComfortLink control codes (with 60-character expandable clear language), plus set points, time of day, temperatures, pressures, and superheat. Additional information can be displayed all at once with the accessory Navigator™ display.

Navigator™ display — An optional 4-line, 20-character per line display also available as a field-installed accessory.

Low-temperature override — This feature prevents LCWT (leaving chilled fluid temperature) from overshooting the set point and possibly causing a nuisance trip-out by the freeze protection.

High-temperature override — This feature allows chiller to add capacity quickly during rapid load variations.

Abnormal conditions — All control safeties in chiller operate through compressor protection board or control relay and microprocessor.

Loss of feedback signal to the MBB will cause the compressor(s) to shut down. For other safeties, microprocessor makes appropriate decision to shut down a compressor due to a safety trip or bad sensor reading and displays appropriate failure code on the display. Chiller holds in safety mode until reset. It then reverts to normal control when unit is reset.

Low-pressure safety — Safety cuts out if system pressure drops below minimum.

High-pressure cutout — Switch shuts down compressors if compressor discharge pressure increases to 641 psig (4420 kPa).

Compressor anti-cycling — This feature limits compressor cycling.

Loss of flow protection — Proof of flow switches are standard and installed on all 30RB chillers.

Sensor failures — Failures are detected by the microprocessor.

Dual chiller control — The ComfortLink controller allows 2 chillers (piped in parallel) to operate as a single chilled water plant with standard control functions coordinated through the master chiller controller. This standard ComfortLink feature requires a communication link between the 2 chillers.

Temperature reset

The Energy Management Module (EMM) is required for 4 to 20 mA reset of LCWT in constant fluid systems. Reset by return fluid, outdoor-air temperature, or space temperature does not require this option. Reset reduces compressor power usage at part load when design LCWT is not necessary. Humidity control should be considered since higher coil temperatures resulting from reset will reduce latent heat capacity. Three reset options are offered, based on the following:

Return-fluid temperature — Increases LCWT set point as return (or entering) fluid temperature decreases (indicating load decrease). Option may be used in any application where return fluid provides accurate load indication. Limitation of return fluid reset is that LCWT may only be reset to value of design return fluid temperature.

Outdoor-air temperature — Increases LCWT as outdoor ambient temperature decreases (indicating load decrease). This reset should be applied only where outdoor ambient temperature is an accurate indication of load. An accessory thermistor is required.

Space temperature — Increases LCWT as space temperature decreases (indicating load decrease). This reset should be applied only where space temperature is an accurate indication of load. An accessory thermistor and the energy management module accessory is required.

For details on applying a reset option, refer to unit Controls and Troubleshooting literature. Obtain ordering part numbers for reset option from the Packaged Chiller Builder program or contact your local Carrier representative.

Accessory controls

Demand can be limited by controlling the chiller capacity through the demand limit control (the Energy Management Module is required for this function). This F1OP/accessory interfaces with microprocessor to control unit so that chiller's kW demand does not exceed its setting. It is activated from an external switch or a 4 to 20 mA signal.

The standard ComfortLink control is programmed to accept various accessory temperature reset options (based on outdoor-air temperature [std], return-fluid temperature, or space temperature), that reset the LCWT. An accessory thermistor (T10) is required if outdoor-air temperature or space temperature reset is selected. The Energy Management Module (EMM) is only required for temperature reset that is initiated by a 4 to 20 mA signal.

Demand limit

If applied, limits the total power draw of unit to selected point by controlling number of operational compressors during periods of peak electrical demand.

The Energy Management Module is required for either 2-step or 4 to 20 mA demand limit.

Electronic expansion valve (EXV)

The EXV controls refrigerant flow to the cooler for different operating conditions by moving an orifice to increase or decrease the flow area through the valve based on microprocessor input. The orifice is positioned by a stepper motor through approximately 3,600 discrete steps and is monitored every three seconds. The EXV maintains an approximate 8° F (5° C) refrigerant superheat entering the compressor.

Diagnostics

The microprocessor may be put through a service test (see Controls, Start-Up, Operation, Service, and Troubleshooting literature). Service test confirms microprocessor is functional, informs observer through display the condition of each sensor and switch in chiller, and allows observer to check for proper operation of fans and compressors.

Default settings

To facilitate quick start-ups, 30RB chillers with *ComfortLink* controls are pre-configured with a default setting that assumes stand-alone operation supplying 44 F (6.7 C) chilled water.

Configuration settings will be based on any options or accessories included with the unit at the time of manufacturing.

Date and time are set to U.S.A. Eastern Time zone and will need reconfiguring based on location and local time zone. If operation based on occupancy scheduling is desired, this will also need to be set during installation.

Ice duty

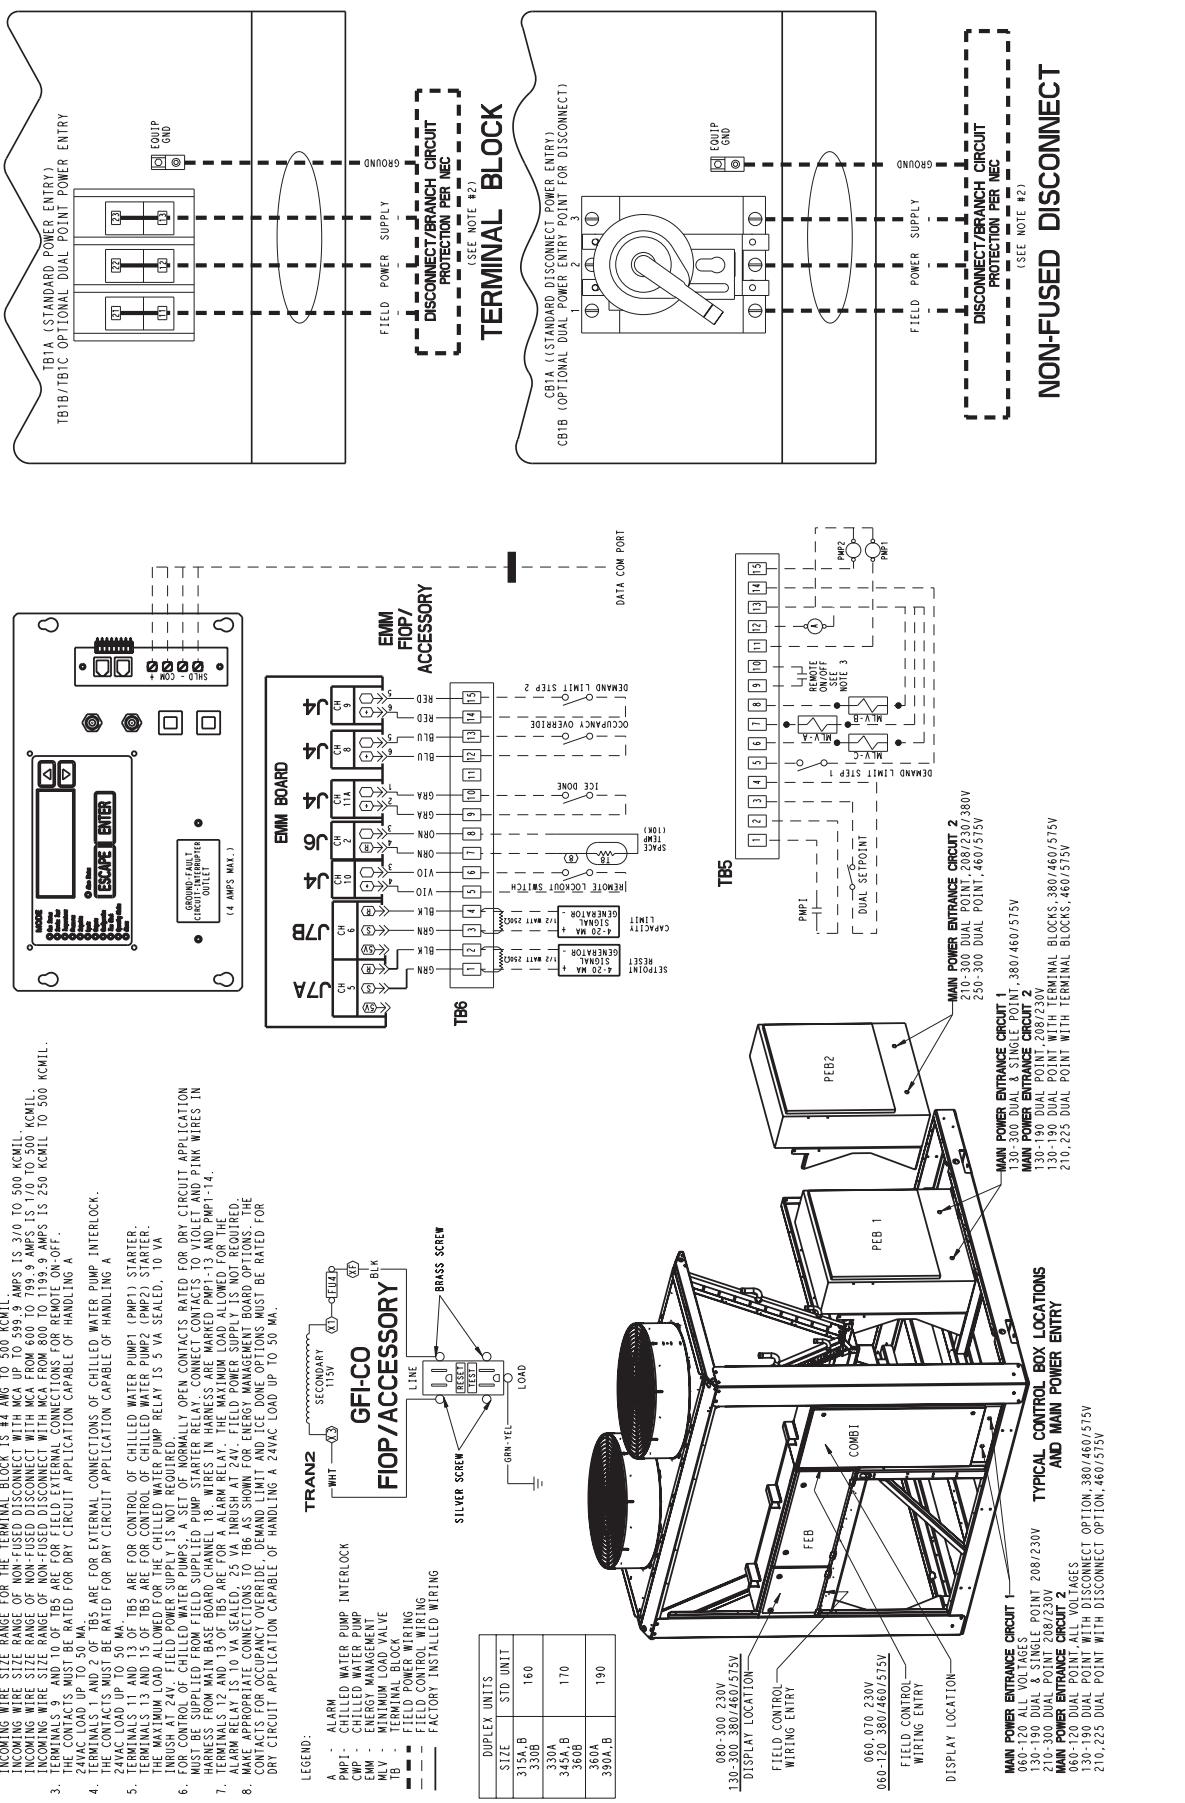

ComfortLink controls have the capability of reduced leaving fluid temperature operation for thermal storage, or ice duty. The optional Energy Management display includes input contacts for the "ice done" signal generated by the thermal storage control system. The ice duty feature may be configured to start on an external input command or by the *ComfortLink* standard internal scheduling function. The ice duty function requires brine modification for leaving fluid temperatures below 40 F (4.4 C). Ice duty may be used in combination with any other standard features offered by the Energy Management Module and *ComfortLink* controls.

The production of ice, which is stored for peak cooling demands, can significantly decrease energy costs. The unit produces ice (normally at night) by supplying ice storage tanks with low temperature cooling fluid. The chiller takes advantage of reduced ambient conditions at night for ice-making mode, so the capacity suffers a lower penalty for the low leaving fluid temperatures.

At peak cooling demands the chiller and the stored ice may share the cooling load to reduce operating costs. The thermal storage system may potentially reduce the size of the chiller plant required to meet demand loads.

Control and power wiring schematic

Carrier®

Application data

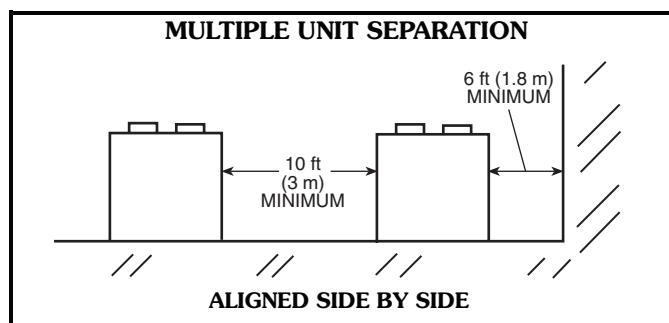

Chiller location and clearances

Do not locate near sound sensitive areas without proper acoustic consideration. For applications requiring mounting a chiller on a building rooftop, consideration should be given to using rubber-in-shear or spring isolators to minimize structure-borne transmission. Unit must be level when installed to ensure proper oil return to the compressors. Clearances must be provided around chillers for airflow, service and local code requirements. See dimensional drawings for specific unit clearance requirements. Ensure adequate clearance between adjacent chillers is maintained. A minimum of 10 ft (3048 mm) is recommended. Chiller fan discharge must be at least as high as adjacent solid walls. Installation in pits is not recommended.

Oversizing chillers

Oversizing chillers by more than 15% at design conditions must be avoided as the system operating efficiency is adversely affected (resulting in greater or excessive electrical demand). When future expansion of equipment is anticipated, install a single chiller to meet present load requirements and add a second chiller to meet the additional load demand. It is also recommended that 2 smaller chillers be installed where operation at minimum load is critical. The operation of a smaller chiller loaded to a greater percentage over minimum is preferred to operating a single chiller at or near its minimum recommended value.

Minimum Load Control should not be used as a means to allow oversizing chillers. Minimum Load Control should be given consideration where substantial operating time is anticipated below the minimum unloading step.

Piping duplex units — The 30RB duplex chillers are shipped and rigged as 2 separate units. The units must be piped in parallel. Module A must be placed on the return side, Module B should be placed on the leaving chilled water side. Minimum spacing of 42 to 48-in. (depending on local codes) between chillers is recommended to provide adequate service access and piping clearance. If the accessory trim kit is used; the modules must be aligned according to the criteria given in the accessory installation instruction. A flexible pipe coupling should be used to allow for module misalignment. Grooved pipe fittings are recommended for use on the interconnecting piping to allow maintenance (cooler tube cleaning) access and to avoid excessive weld slag form being flushed through the cooler during initial start-up.

Multiple chillers

Where chiller capacities greater than can be supplied by a single 30RB chiller are required, or where stand-by capability is desired, chillers may be installed in parallel. Units may be of the same or different sizes. However, cooler flow rates must be balanced to ensure proper flow to each chiller.

Where applied in parallel with optional hydronic package, expansion tank must be disconnected and a single expansion tank must be installed in the common header.

Unit software is capable of controlling two units as a single plant. Refer to the Controls, Start-up, Operation, Service, and Troubleshooting guide for further details. The accessory Chillervisor System Manager can be used to ensure proper staging sequence of up to 8 chillers. Isolated valves on individual chiller pumps are recommended for parallel chiller arrangements. Refer to the accessory Chillervisor System Manager installation instructions for further details. Hydronic pump package may not be applied in series applications.

Series chillers

Where a large temperature drop (greater than 20 F [11.1 C]) is desired or where chiller capacities greater than can be supplied by a single 30RB chiller are required or where stand-by capability is required, chillers may be installed in series. The leaving fluid temperature sensors need not be relocated. However, the cooler minimum entering fluid temperature limitations should be considered for the chillers located downstream of other chillers. Use of reduced pass heads may be required to keep waterside pressure drop at an acceptable level.

Minimum clearances

The recommended minimum clearance to ensure proper airflow through the condenser coils and to allow fan maintenance is as shown below.

Acceptable clearance on the cooler connection side or end opposite the control box of the unit can be reduced to 3 feet (1 m) without sacrificing performance as long as the remaining three sides are unrestricted. Acceptable clearance on the side with a control box can be reduced to 4 ft (1.3 m) due to NEC (National Electric Code) regulations, without sacrificing performance as long as the remaining three sides are unrestricted.

Cooler water temperature

1. Maximum leaving chilled water temperature (LCWT) for the unit is 60 F (15.6 C). Unit can start and pull down with up to 95 F (35 C) entering-water temperature. It is recommended that entering-water temperature not exceed 80 F (26.7 C).
2. Minimum LCWT for standard unit is 40 F (4.4 C). For leaving-fluid temperatures between 30 and 39.9 F (-1.1 C and 3.28 C) an inhibited antifreeze solution is required. Application of chiller to 30 F (-1.1 C) is possible by ordering the factory-installed medium temperature brine option.

NOTE: Water flowing through cooler should not exceed 100 F (38 C).

Application data (cont)

Strainers

It is recommended that a strainer with a minimum of 20 mesh be installed in the cooler fluid inlet line, just ahead of (and as close as possible) to the cooler.

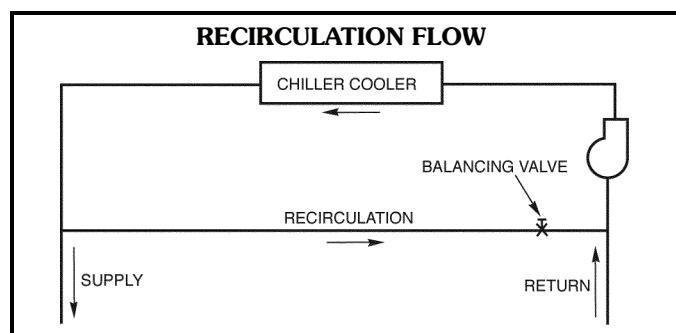

Cooler flow/range

Ratings and performance data in this publication are for a cooling temperature rise of 10° F (6° C). The 30RB chillers may be operated at a different temperature rise, providing flow limits are not exceeded and corrections to system guidelines are made. For minimum and maximum cooler flow rates, see the Minimum and Maximum Cooler Flow Rates table. A high flow rate is generally limited by the maximum pressure drop that can be tolerated by the unit. The 30RB chillers are designed for a full load temperature rise of 5° to 20° F (2.8° to 11.1° C). Use the Packaged Chiller Builder Program to obtain the rating if a temperature rise other than 10° F (6° C) is used.

Minimum cooler flow (maximum cooler temperature rise) — The minimum cooler flow for standard units is shown in Minimum Cooler Fluid Flow Rates table. When system design conditions require a lower flow (or higher rise) than the minimum allowable cooler flow, follow the recommendations below.

- Multiple smaller chillers may be applied in series, each providing a portion of the design temperature rise.
- Cooler fluid may be recirculated to raise the flow rate to the chiller. However, the mixed temperature entering cooler must be maintained a minimum of at least 5° F (2.8° C) above the LCWT.

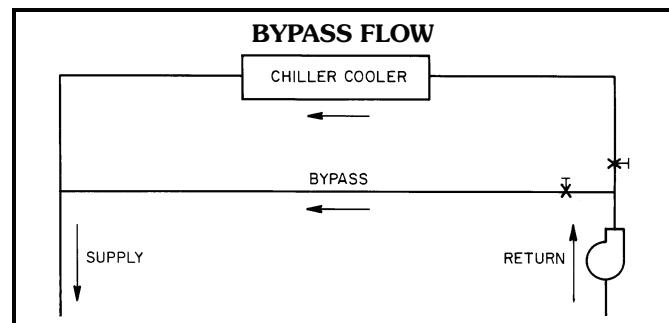

NOTE: Recirculation flow is shown below.

Maximum cooler flow — The maximum cooler flow (approximately 5° F [2.8° C] rise) results in a practical maximum pressure drop through cooler.

Return fluid may bypass the cooler to keep the pressure drop through the cooler within acceptable limits. This permits a higher delta T with lower fluid flow through cooler and mixing after the cooler.

NOTE: Bypass flow is shown below.

Variable cooler flow rates

Variable rates may be applied to a standard chiller. The unit will, however, attempt to maintain a constant leaving chilled water temperature. In such cases, minimum flow must be in excess of minimum flow given in the Minimum and Maximum Cooler Fluid Flow Rates table, and minimum fluid volume must be in excess of 3 gallons per ton (3.2 L per kW). Flow rate must change in steps of less than 10% per minute. Apply 6 gal. or more per ton (6.5 L per kW) water loop volume minimum if flow rate changes more rapidly.

Fluid loop volume

The volume in circulation must equal or exceed 3 gal. per nominal ton (3.25 L per kW) of cooling for temperature stability and accuracy in normal air conditioning applications. In process cooling applications, or for operation at ambient temperature below 32 F (0° C) with low loading conditions, there should be from 6 to 10 gal. per ton (6.5 to 10.8 L per kW). To achieve this volume, it is often necessary to install a tank in the loop.

Tank should be baffled to ensure there is no stratification and that water (or brine) entering tank is adequately mixed with liquid in the tank.

Cooler fouling factor

The fouling factor used to calculate tabulated ratings is 0.00010 ft² · hr · °F/Btu (0.000018 m² · °C/W). As fouling factor is increased, unit capacity decreases and compressor power increases. Corrections to published ratings can be approximated by using following multipliers:

FOULING FACTORS

FOULING FACTOR (English) (ft ² ·hr·F/Btu)	FOULING FACTOR (SI) (m ² ·C/kW)	CAPACITY MULTIPLIER	COMPRESSOR POWER MULTIPLIER
.00025	.000044	0.991	0.995
.00050	.000088	0.977	0.987
.00075	.000132	0.955	0.979
.00175	.000308	0.910	0.952

Cooler and hydronic system freeze protection

Freeze protection for down to -20 F (-28.9 C) for the cooler and hydronic package is available as a factory-installed option. Since power is sometimes lost for extended periods during winter storms, freeze protection provided by heater tapes will be effective only if a back-up power supply can be assured for the unit's control circuit, heater and cooler pump. If not protected with an antifreeze solution, draining the cooler and outdoor piping is recommended if the system will not be used during freezing weather conditions.

Application data (cont)

Two conditions that must be considered when determining antifreeze concentration are leaving water set point and ambient freeze conditions. Both of these parameters can help determine the recommended concentration level. Higher concentration must be used to adequately protect the machine.

NOTE: Use only antifreeze solutions approved for heat exchanger duty.

For applications in which the leaving water temperature set point is less than 40 F (4.4 C), a suitable inhibited antifreeze solution must be used. The solution concentration must be sufficient to protect the chilled water loop to a freeze protection (first crystals) concentration of at least 15° F (8.3° C) below the leaving water temperature set point.

If the chiller refrigerant or fluid lines are in an area where ambient conditions fall below 34° F (1° C), it is required that an antifreeze solution be added to protect the unit and fluid piping to a temperature of 15° F (8.3° C) below the lowest anticipated ambient temperature.

Select concentration based on either burst or freeze protection as dictated by the application. If the chiller does not operate during the winter, nor is a start-up expected, a burst protection concentration is recommended. This concentration may not be high enough to pump the fluid through the unit. Burst protection is typically a lower concentration that will provide better performance from the machine. If the chiller does operate during winter, a freeze protection concentration is recommended. This concentration will be high enough to keep the fluid in a condition that it can be pumped at low ambient conditions.

IMPORTANT: Glycol anti-freeze solutions are highly recommended since heater tapes provide no protection in the event of a power failure.

Consult glycol fluid manufacturers for burst protection recommendations and fluid specifications.

High ambient temperature operation

High outdoor ambient chiller start-up and operation is possible for standard 30RB chillers at ambient temperatures up to 125 F (52 C) at nominal voltage. In some cases, where return water temperature is expected to exceed 60 F (15.5 C), an accessory kit may be required.

Low ambient temperature operation

Units will start and operate down to 32 F (0° C) as standard.

NOTE: Minimum load on chiller must be above the minimum step of unloading.

Operation to -20 F (-29 C) requires optional low ambient head pressure control as well as wind baffles (field fabricated and installed to all units for operation below 32 F [0° C]) if wind velocity is anticipated to be greater than 5 mph (8 km/h). Inhibited propylene glycol or other suitable corrosion-resistant anti-freeze solution must be field supplied and installed in all units for unit operation below 34 F (1° C). Solution must be added to fluid loop to protect loop down to 15° F (8° C) below minimum operating ambient temperature. Concentration should be based on

expected minimum temperature and either "Burst" or "Freeze" protection levels. At least 6 gal per ton (6.5 L per kW) of fluid volume is the recommended minimum for a moderate system load.

Altitude correction factors

Correction factors must be applied to standard ratings at altitudes above 2000 ft (610 m) using the following multipliers:

ALTITUDE CORRECTION FACTORS

ALTITUDE (ft)	ALTITUDE (m)	CAPACITY MULTIPLIER	COMPRESSOR POWER MULTIPLIER
2,000	610	0.99	1.01
4,000	1220	0.98	1.02
6,000	1830	0.97	1.03
8,000	2440	0.96	1.04
10,000	3050	0.95	1.05

Condenser airflow — Airflow restrictions on units with standard fans will affect the unit capacity, condenser head pressure, and compressor power input. Correction factors to be applied for external static restrictions up to 0.2 in. wg (50 Pa) are as follows:

EXTERNAL STATIC in. wg	Pa	CAPACITY	COMPRESSOR
		MULTIPLIER	POWER MULTIPLIER
0.0	0.0	1.000	1.00
0.1	25	0.986	1.01
0.2	50	0.968	1.03

Condenser coil protection (*Enviro-Shield*™)

Refer to the Environmental Corrosion Protection white paper for more information.

Pre-coated aluminum-fin coils have a durable epoxy-phenolic coating applied to the fin prior to the fin stamping process to provide protection in mildly corrosive coastal environments. Pre-coated coils have an inert barrier between the aluminum fin and copper tube. This barrier electrically disconnects the dissimilar metals to minimize the potential for galvanic corrosion. This economical option provides substantial corrosion protection beyond the standard uncoated coil construction.

Copper-fin coils provide increased corrosion resistance in moderate coastal environments where industrial air pollution is not present. All copper coils eliminate bimetallic construction to eliminate the potential for galvanic corrosion. Application in industrial environments is not recommended due to potential attack from sulfur, sulfur oxide, nitrogen oxides, carbon and several other industrial airborne contaminants. In moderate seacoast environments, copper-fin coils have extended life compared to standard or pre-coated aluminum-fin coils.

E-coated aluminum-fin coils have an extremely flexible and durable epoxy coating uniformly applied to all coil surfaces. Unlike brittle phenolic dip and bake coatings, E-coat provides superior protection with unmatched flexibility, edge coverage, metal adhesion, thermal performance and most importantly, corrosion resistance. E-coated coils provide this protection since all coil surfaces are completely encapsulated from environmental contamination.

Specify E-coated aluminum-fin coils for industrial environments with high levels of air pollution. This option also provides better protection compared to standard or pre-coated aluminum-fin coils in industrial environments.

E-coated copper-fin coils have the same flexible and durable epoxy coating as E-coated aluminum-fin coils. However, this option combines the natural salt and environmental resistance of all-copper construction with the highest level of corrosion protection. Specify E-coated copper-fin coils in the harshest combination of coastal and industrial environments.

Electrical/utility interests

Energy management — Use of energy management practices can significantly reduce operating costs, especially during off-peak modes of operation. Demand limiting and temperature reset are 2 techniques for accomplishing efficient energy management. See Demand Limiting (also called load shedding) section below for further details.

Demand limiting (load shedding)

When a utility's demand for electricity exceeds a certain level, loads are shed to keep electricity demand below a prescribed maximum level. Typically, this happens on hot days when air conditioning is most needed. The Energy Management Module (EMM) can be added to accomplish this reduction. Demand may be limited on unit by resetting fluid temperature, or by unloading the chiller to a given predetermined percentage of the load. Demand limit may also be driven by an external 4 to 20 mA signal. These features require a signal from an intelligent central control. Do not cycle demand limiter for less than 10 minutes on and 5 minutes off. Duty cycling cycles electrical loads at regular intervals regardless of need. This reduces the electrical operating costs of building by "fooling" demand indicating devices. Duty cycling of compressors or fans is not recommended since motor winding and bearing life will suffer from constant cycling.

Remote on-off control

Remote on-off control may be applied by hard-wired connection (see Controls and Troubleshooting literature) or by connection to a Carrier Comfort Network® (CCN) system.

Optional hydronic system selection

Select pump gpm from resulting chiller selection and total pressure loss in the system plus the chiller internal pressure loss.

NOTE: Maximum gpm (L/s), pressure and pump hp must not exceed maximum on pump curve.

Pump flow can be reduced by using the factory-supplied triple-duty valve up to 10%. Beyond that, impeller trimming is recommended to reduce energy consumption. Follow local codes or ASHRAE 90.1 recommendations. Contact your Carrier representative for specific amount of trim required.

The 30RB AquaSnap® chiller will require a field-supplied expansion tank when the optional pumping package is provided.

The expansion tank is based on fluid type, temperature range, fluid pressure and loop volume.

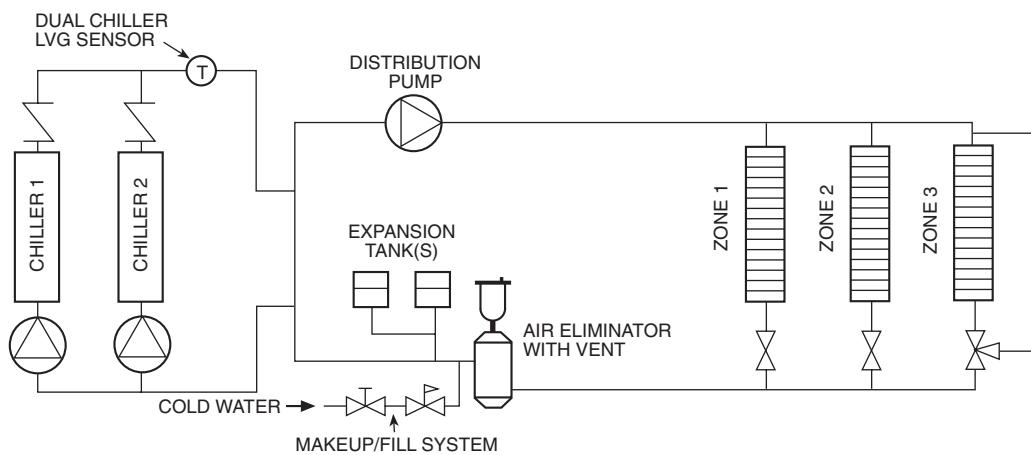

Parallel chillers with hydronic packages require that pump inlets be equalized to prevent pump cavitation. Pump expansion tanks must be removed and located together in the common pump suction header. All materials needed for expansion tank relocation are field supplied. Appropriate measures must be taken for freeze protection.

Air separation

The 30RB AquaSnap chiller will require a field-supplied air separation device when the optional pumping package is provided.

Air must be controlled in a hydronic system if it is to perform properly. Air can block the flow of chilled water to its destinations and can cause cavitation in the pump, which will aerate the pump and potentially cause pump failure. The air separator is sized according to the total flow through the system. The air separator should be located inside the building. There are several types of air separators to choose from. For more information and product selection contact your local manufacturer's representative.

Guide specifications

Air-Cooled Liquid Chiller

HVAC Guide Specifications

Size Range: **60 to 390 Tons
(210 to 1370 kW) Nominal**

Carrier Model Number: **30RB**

Part 1 — General

1.01 SYSTEM DESCRIPTION

Microprocessor controlled, air-cooled liquid chiller utilizing scroll compressors, low sound fans and optional hydronic pump system.

NOTE: Hydronic pump packages are only available on 30RB060-190 units.

1.02 QUALITY ASSURANCE

- A. Unit shall be rated in accordance with ARI Standard 550/590, latest revision (U.S.A.).
- B. Unit construction shall comply with ASHRAE 15 Safety Code, UL 1995, and ASME applicable codes (U.S.A. codes).
- C. Unit shall be manufactured in a facility registered to ISO 9001:2000 Manufacturing Quality Standard.
- D. Unit shall be full load run tested at the factory.

1.03 DELIVERY, STORAGE AND HANDLING

- A. Unit controls shall be capable of withstanding 150 F (66 C) storage temperatures in the control compartment.
- B. Unit shall be stored and handled per unit manufacturer's recommendations.

Part 2 — Products

2.01 EQUIPMENT

A. General:

Factory assembled, single-piece or factory-matched duplex chassis, air-cooled liquid chiller. Contained within the unit cabinet shall be all factory wiring, piping, controls, refrigerant charge (R-410A), and special features required prior to field start-up.

B. Unit Cabinet:

- 1. Frame shall be of heavy-gage, painted galvanized steel.
- 2. Cabinet shall be galvanized steel casing with a baked enamel powder or pre-painted finish.
- 3. Cabinet shall be capable of withstanding 500-hour salt spray test in accordance with the ASTM (U.S.A.) B-117 standard.

C. Fans:

- 1. Condenser fans shall be direct-driven, 9-blade airfoil cross-section, reinforced polymer construction, shrouded-axial type, and shall be statically and dynamically balanced with inherent corrosion resistance.
- 2. Air shall be discharged vertically upward.
- 3. Fans shall be protected by coated steel wire safety guards.

D. Compressor/Compressor Assembly:

- 1. Fully hermetic scroll type compressors.
- 2. Direct drive, 3500 rpm (60 Hz), protected by motor temperature sensors, suction gas cooled motor.
- 3. External vibration isolation rubber-in-shear.
- 4. Each compressor shall be equipped with crank-case heaters to minimize oil dilution.

E. Cooler:

- 1. Shell-and-tube type, direct expansion.
- 2. Tubes shall be internally enhanced seamless-copper type rolled into tube sheets.
- 3. Shall be equipped with Victaulic-type fluid connections.
- 4. Shell shall be insulated with 3/4-in. (19-mm) PVC foam (closed-cell) with a maximum K factor of 0.28.
- 5. Design shall incorporate a minimum of 2 independent direct-expansion refrigerant circuits.
- 6. Cooler shall be tested and stamped in accordance with ASME Code for a refrigerant working side pressure of 445 psig (3068 kPa). Cooler shall have a maximum fluid-side pressure of 300 psig (2068 kPa).

F. Condenser:

- 1. Coil shall be air-cooled with integral subcooler, and shall be constructed of aluminum fins mechanically bonded to seamless copper tubes.
- 2. Tubes shall be cleaned, dehydrated, and sealed.
- 3. Assembled condenser coils shall be leak tested and pressure tested at 656 psig (4522 kPa).

G. Refrigeration Components:

Refrigerant circuit components shall include replaceable-core filter drier, moisture indicating sight glass, electronic expansion device, discharge service valve and liquid line service valves, and complete operating charge of both refrigerant R-410A and compressor oil.

H. Controls, Safeties, and Diagnostics:

- 1. Unit controls shall include the following minimum components:
 - a. Microprocessor with non-volatile memory. Battery backup system shall not be accepted.
 - b. Separate terminal block for power and controls.
 - c. Control transformer to serve all controllers, relays, and control components.
 - d. ON/OFF control switch.
 - e. Replaceable solid-state controllers.
 - f. Pressure sensors installed to measure suction and discharge pressure. Thermistors installed to measure cooler entering and leaving fluid temperatures.

2. Unit controls shall include the following functions:
 - a. Automatic circuit lead/lag.
 - b. Hermetic scroll compressors are maintenance free and protected by an auto-adaptive control that minimizes compressor wear.
 - c. Capacity control based on leaving chilled fluid temperature and compensated by rate of change of return-fluid temperature with temperature set point accuracy to 0.1° F (0.06° C).
 - d. Limiting the chilled fluid temperature pull-down rate at start-up to an adjustable range of 0.2° F to 2° F (0.11° C to 1.1° C) per minute to prevent excessive demand spikes at start-up.
 - e. Seven-day time schedule.
 - f. Leaving chilled fluid temperature reset from return fluid and outside air temperature.
 - g. Chilled water pump start/stop control and primary/standby sequencing to ensure equal pump run time.
 - h. Dual chiller control for parallel chiller applications without addition of hardware modules, control panels.
 - i. Timed maintenance scheduling to signal maintenance activities for pumps, strainer maintenance and user-defined maintenance activities.
 - j. Low ambient protection to energize cooler and hydronic system heaters.
 - k. Periodic pump start to ensure pump seals are properly maintained during off-season periods.
 - l. Single step demand limit control activated by remote contact closure.
 - m. Night time sound mode to reduce the sound of the machine by a user-defined schedule.
 3. Diagnostics:
 - a. The control panel shall include, as standard, a Scrolling Marquee display capable of indicating the safety lockout condition by displaying a code for which an explanation may be scrolled at the display with time and date stamp.
 - b. Information included for display shall be:
 - 1) Compressor lockout.
 - 2) Loss of charge.
 - 3) Low fluid flow.
 - 4) Cooler freeze protection.
 - 5) Cooler set point.
 - 6) Chilled water reset parameters.
 - 7) Thermistor and transducer malfunction.
 - 8) Entering and leaving-fluid temperature.
 - 9) Evaporator and condenser pressure.
 - 10) System refrigerant temperatures.
 - 11) Chiller run hours.
- 12) Compressor run hours.
 13) Compressor number of starts.
 14) Time of day:
 a) Display module, in conjunction with the microprocessor, must also be capable of displaying the output (results) of a service test. Service test shall verify operation of every switch, thermistor, fan, and compressor before chiller is started.
 b) Diagnostics shall include the ability to review a list of the 30 most recent alarms with clear language descriptions of the alarm event. Display of alarm codes without the ability for clear language descriptions shall be prohibited.
 c) An alarm history buffer shall allow the user to store no less than 30 alarm events with clear language descriptions, time and date stamp event entry.
 d) The chiller controller shall include multiple connection ports for communicating with the local equipment network, the Carrier Comfort Network® (CCN) system and access to chiller control functions from any point on the chiller.
 e) The control system shall allow software upgrade without the need for new hardware modules.
- 15) Crankcase heater failure.
4. Safeties:
- a. Unit shall be equipped with thermistors and all necessary components in conjunction with the control system to provide the unit with the following protections:
 - 1) Loss of refrigerant charge.
 - 2) Reverse rotation.
 - 3) Low chilled fluid temperature.
 - 4) Thermal overload.
 - 5) High pressure.
 - 6) Electrical overload.
 - 7) Loss of phase.
 - b. Condenser fan and factory pump motors shall have external overcurrent protection.
- I. Operating Characteristics:
1. Unit shall be capable of starting and running at outdoor ambient temperatures from 32 F to 125 F (0° to 52 C) for all sizes.
 2. Unit shall be capable of starting up with 95 F (35 C) entering fluid temperature to the cooler.
- J. Motors:
- Condenser-fan motors shall be totally enclosed single speed, 3-phase type with permanently lubricated bearings and Class F insulation.

Guide specifications (cont)

K. Electrical Requirements:

1. Unit/module primary electrical power supply shall enter the unit at a single location (some chiller voltage/size combinations require 2 power supplies).
2. Unit shall operate on 3-phase power at the voltage shown in the equipment schedule.
3. Control points shall be accessed through terminal block.
4. Unit shall be shipped with factory control and power wiring installed.

L. Chilled Water Circuit:

1. Chilled water circuit shall be rated for 300 psig (2068 kPa). Units with optional pump package are rated for 150 psig (1034 kPa) working pressure.
2. Thermal dispersion proof of flow switch shall be factory installed and wired.
3. Optional hydronic package:
 - a. Field pipe connections shall be Victaulic type.
 - b. Optional single or primary/stand-by operation pump systems. Dual pump systems shall have a pump discharge check valve.
 - c. Pumps shall be single stage design, for installation in vertical position and capable of being serviced without disturbing piping connections.
 - 1) Pump casing shall be of class 30 cast iron.
 - 2) The impeller shall be of cast bronze, closed type, dynamically balanced, keyed to the shaft and secured by locking cap screw.
 - 3) The hydronic kit will be provided with a flush line connection to ensure lubrication at the seal face and allow for positive venting of the seal chamber.
 - 4) Each port shall be fitted with an isolation valve that allow the units to operate in parallel or standby, yet may be used to isolate one pumping unit for servicing or removal with the other pump still running.
 - 5) Pump shall be rated for 150 psig (1034 kPa) working pressure.
 - 6) The pump case shall have gage tappings at the suction and discharge nozzles and include drain ports.
 - 7) Dual pumps shall allow for the servicing of one pump without draining the chilled water loop.
 - 8) Motors shall totally enclosed 3-phase type with grease lubricated ball bearings.
 - 9) Each pump shall be factory tested per Hydraulic Institute Standards.

- d. Pressure/temperature taps (3) shall be factory installed to measure the pressure differential across the pump and across the strainer.
- e. Combination valve shall be factory installed. Pressure/temperature taps (2) shall be factory installed to measure the pressure differential across the combination valve.
- f. Hydronic assembly shall have factory supplied electric freeze protection to -20 F (-29 C).
- g. Piping shall be Schedule 40 black steel.
- h. Cast iron or ductile iron body strainer with 8 mesh screen. A factory-installed, removable fine mesh clean-out strainer for initial run period shall be included.

M. Special Features:

Certain standard features are not applicable when the features designated by * are specified. For assistance in amending the specifications, contact your Carrier representative.

- * 1. Low Ambient Head Pressure Control:
Unit shall be capable of starting and running at outdoor ambient temperatures down to -20 F (-29 C) with the addition of antifreeze in the cooler circuit, wind baffles, and field-installed or factory-installed solid-state head pressure control with condenser coil minimum step capacity temperature sensor.
- 2. Unit-Mounted Non-Fused Disconnect:
Unit shall be supplied with factory-installed, non-fused electrical disconnect for main power supply.
- 3. Optional Condenser Coil Materials:
 - a. Pre-coated aluminum fin coils:
Shall have a durable epoxy-phenolic coating to provide protection in mildly corrosive coastal environments. Coating shall be applied to the aluminum fin stock prior to the fin stamping process to create an inert barrier between the aluminum fin and copper tube. Epoxy-phenolic barrier shall minimize galvanic action between dissimilar metals.
 - b. Copper-fin coils:
Shall be constructed of copper fins mechanically bonded to copper tubes and copper tube sheets. Galvanized steel tube sheets shall not be acceptable. A polymer strip shall prevent coil assembly from contacting sheet metal coil pan to minimize potential for galvanic corrosion between the coil and pan. All copper construction shall provide protection in moderate coastal applications.

- c. E-Coated aluminum-fin coils:

Shall have a flexible epoxy polymer coating uniformly applied to all coil surface areas without material bridging between fins. Coating process shall ensure complete coil encapsulation. Color shall be high gloss black with gloss — 60° of 65-90% per ASTM D523-89. Uniform dry film thickness from 0.8 to 1.2 mil on all surface areas including fin edges. Superior hardness characteristics of 2H per ASTM D3363-92A and cross hatch adhesion of 4B-5B per ASTM D3359-93. Impact resistance shall be up to 160 in./lb (ASTM D2794-93). Humidity and water immersion resistance shall be up to minimum 1000 and 250 hours respectively (ASTM D2247-92 and ASTM D870-92). Corrosion durability shall be confirmed through testing to no less than 3000 hours salt spray per ASTM B117-90. Coil construction shall be aluminum fins mechanically bonded to copper tubes.
- d. E-Coated copper-fin coils:

Shall have a flexible epoxy polymer coating uniformly applied to all coil surface areas without material bridging between fins. Coating process shall ensure complete coil encapsulation. Color shall be high gloss black with gloss — 60° of 65-90% per ASTM D523-89. Uniform dry film thickness from 0.8 to 1.2 mil on all surface areas including fin edges. Superior hardness characteristics of 2H per ASTM D3363-92A and cross hatch adhesion of 4B-5B per ASTM D3359-93. Impact resistance shall be up to 160 in./lb (ASTM D2794-93). Humidity and water immersion resistance shall be up to minimum 1000 and 250 hours respectively (ASTM D2247-92 and ASTM D870-92). Corrosion durability shall be confirmed through testing to no less than 3000 hours salt spray per ASTM B117-90. Coil construction shall be copper-fins mechanically bonded to copper tube sheets. Galvanized steel tube sheets shall not be acceptable. A polymer strip shall prevent coil assembly from contacting sheet metal coil pan to maintain coating integrity and minimize corrosion potential between the coil and pan.
- 4. Remote Enhanced Display:

Unit shall be supplied with indoor-mounted, remote, 40-character per line, 16-line display panel for field installation.
- 5. Medium Temperature Brine:

Unit shall be factory modified to start and operate at leaving chilled fluid temperatures between 30 F (-1.1 C) and 39 F (3.9 C).
- 6. Chillervisor System Manager Multi-Unit Control:

Field-installed control shall sequence between 2 and 8 chillers in parallel in a single system. System shall control chilled water pumps.
- 7. Minimum Load Control:

Unit shall be equipped with factory (or field) installed, microprocessor-controlled, minimum-load control that shall permit unit operation down to a minimum of 15% capacity (varies with unit size).
- 8. Energy Management Control Module:

A factory or field-installed module shall provide the following energy management capabilities: 4 to 20 mA signals for leaving fluid temperature reset, cooling set point reset or demand limit control; 2-step demand limit control (from 0% to 100%) activated by a remote contact closure; and discrete input for "Ice Done" indication for ice storage system interface.
- 9. Condenser Coil Trim Panels and Security Grilles:

Unit shall be supplied with factory or field-installed coil covers and painted grilles to protect the condenser coil and internal chiller components from physical damage.
- 10. Hail Guards:

Field-installed accessory kit shall include set of metal grilles for the protection of the condensing coils from hail damage.
- 11. DataPort™ Control:

Unit shall be supplied with field-installed interface device that allows a non-Carrier device such as a personal computer or non-Carrier controller to *read* values in system elements connected to the CCN Communication Bus using plain English ASCII over its RS-232 connection.
- 12. DataLINK™ Control:

Unit shall be supplied with field installed interface device that allows a non-Carrier device such as a personal computer or non-Carrier controller to *read and change values* in system elements connected to the CCN Communication Bus using plain English ASCII over its RS-232 connection.
- 13. BACnet™ Translator Control:

Unit shall be supplied with field-installed interface between the chiller and a BACnet Local Area Network (LAN, i.e., MS/TP EIA-485).
- 14. LON Translator control:

Unit shall be supplied with field-installed interface between the chiller and a Local Operating Network (LON, i.e., LonWorks FT-10A ANSI/EIA-709.1).

Guide specifications (cont)

15. Navigator™ Hand Held Display:
 - a. Portable hand held display module with a minimum of 4 lines and 20 characters per line, of clear English, Spanish, Portuguese or French language.
 - b. Display menus shall provide clear language descriptions of all menu items, operating modes, configuration points and alarm diagnostics. Reference to factory codes shall not be accepted.
 - c. RJ-14 connection plug shall allow display module to be connected to factory-installed receptacle.
 - d. Industrial grade coiled extension cord shall allow the display module to be moved around the chiller.
 - e. Magnets shall hold the display module to any sheet metal panel to allow hands-free operation.
 - f. Display module shall have NEMA 4x housing suitable for use in outdoor environments.
 - g. Display shall have back light and contrast adjustment for easy viewing in bright sunlight or night conditions.
 - h. Raised surface buttons with positive tactile response.
16. Leaving chilled fluid temperature reset from return fluid, outdoor air temperature, space temperature (requires additional sensor and the Energy Management Control Module) or 4 to 20 mA input (requires Energy Management Control Module).
17. Chilled Water Expansion Tank:
Enables chilled water system to accommodate fluctuations in volume based on increases or decreases in fluid temperature.
18. Removable Core Filter Drier (60 to 100 ton):
Standard units are equipped with a removable core filter drier. An option exists for non-removable core filter driers for value engineering purposes. This option is not available with the Medium Temperature Brine option.
19. Compressor Suction Service Valve:
Standard refrigerant discharge isolation and liquid valves enable service personnel to store the refrigerant charge in the cooler or condenser during servicing. This factory-installed option allows for further isolation of the compressor from the cooler vessel.
20. Suction Line Insulation:
Insulation is tubular closed-cell insulation. This option is required with the Medium Temperature Brine option and recommended for areas of high dewpoints where condensation may be a concern.
21. Freeze Protection Cooler Heaters:
Cooler heaters provide protection from cooler freezeup to -20 F (-29 C).
22. Remote Cooler Kit:
Allows remote installation of cooler. Kit includes expansion valve and flow switch cable extensions, and instructions.
23. Service Option:
The service option provides a remote service port for Navigator connection and a factory-installed convenience outlet includes 4-amp GFI (Ground Fault Interrupt) receptacle with independent fuse protection. Convenience outlet is 115-v female receptacle. Service option not available with 380 v.
24. Low-Sound Compressor Enclosures:
Provide sound reduction for the scroll compressors.

Carrier

A United Technologies Company
